## **Federal Communications Commission (FCC) Statement**

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his expense.

The user is cautioned that changes and modifications made to the equipment without approval of the manufacturer could void the user's authority to operate this equipment.

5.5 About Korenix .....149

# 1 Introduction

Welcome to Korenix *JetNet 5310G* Series Industrial 8-Port PoE + 2Gigabit Copper / SFP Managed Ethernet Switch User Manual. Following topics are covered in this chapter:

## **1.1 Overview**

## **1.2 Major Features**

## **1.3 Package Checklist**

### **1.1 Overview**

Korenix JetNet 5310G, the revolutionary DIN Rail type industrial Gigabit managed Power over Ethernet Switch is designed with eight 10/100TX PoE injector ports and two Gigabit RJ-45 / SFP combo ports for highly critical PoE applications such as real time IP video surveillance, WiMAX systems and Wireless APs. All of the 8 ports of the switch are compliant with both IEEE 802.3af PoE and IEEE 802.3at high power PoE standards and can deliver up to 15.4W and 30W power per port to enable the high-power requiring devices, such as Wireless APs, PTZ and dome network cameras, etc.

The two Gigabit Ethernet combo ports provide high speed uplink to connect with higher level backbone switches with Korenix MSR™ network redundancy technology, while ensuring the reliability of video transfer through the exclusive 5ms recovery time. By supporting various connection types, including 10/100/1000Mbps RJ-45 copper or 100Mbps, 1000Mbps Fiber, the Gigabit uplink ports further enlarge the ring infrastructure.

With IEC 61000-6-2 / 61000-6-4 Heavy Industrial EMC certified design, including robust enclosure and -40~75°C wide operating temperature range, JetNet 5310G ensures high performance of the surveillance network under vibrating and shock environments in rolling stocks, traffic control systems and other harsh surveillance applications.

#### ***Driving the IP Surveillance Market***

Since the ratification of the Power over Ethernet standard in 2003, the PoE technology becomes a trend; more devices adopt PD function to obtain power through Ethernet cable eliminating the need of running separate power wirings to a remote device. The JetNet 5310G is equipped with the new PSE solution, compliant with **IEEE 802.3af**, **IEEE 802.3at 2-event** or **IEEE 802.3at 2-event plus LLDP** standards, as well as forced mode powering mode for legacy Power over Ethernet cable devices. The 8 PoE ports support LLDP power negotiation function or 2-Event classification of IEEE 802.3at PoE plus, and can therefore deliver up to 30W power per port and

12 W per unit at 60°C operating temperature, to drive the IP cameras for cross-street monitoring or WiMAX systems for internet accesses at train stations, airports or Hot-spots.

### ***100/1000Mbps DDM SFP transceiver for High Quality Monitoring***

The SFP sockets of the JetNet 5310G supports 100Mbps and 1000Mbps SFP type fiber transceiver with speed detection and independent indication. Moreover, it supports DDM (Digital Diagnostic Monitoring) type SFP transceivers allowing users to diagnose optical cable transmission problem through maintenance and debugging of the optical signal quality by DDM without the need of an extra optical cable analyzer, as a result greatly saving time and system costs.

### ***Rapid Super Ring (RSR™) Technology***

The JetNet 5310G supports Rapid Super Ring technology, which is the 2nd generation of Korenix Ring Redundancy technology. The recovery time is greatly improved from 30ms to few ms for both copper and fiber ring. The Ring master can be auto-selected by RSR engine. The 1st ring port of the R.M. is the primary path while the 2nd ring port of the R.M. is the block path. Once the primary path fails, the 2nd path will be recovered within few ms. In addition, the restoration time is also shortened to zero in the R.M. auto-selection mode.

### ***Comprehensive Redundant Solutions – Multiple Super Ring (MSR™)***

JetNet 5310G also supports advanced Ring technology – M.S.R. (Multiple Super Ring) which includes various new technologies for different network redundancy applications and structures. The supported MSR allows JetNet 5310G aggregating up to 5 Rapid Super rings includes 4 Fast Ethernet plus 1 Gigabit Ethernet rings into one switch. With the MSR™ technology, a node can be configured to multiple rings with the failover time. In addition, users can extend the ring topology by adding hundreds of JetNet managed switches to meet the large-scale network needs without compromising the network speed. The MSR™ also allows JetNet 5310G managed switch to easily connect with core management switches via standard Rapid Spanning Tree Protocol (RSTP) or through multiple paths or nodes to increase the reliability by RDH™ (Rapid Dual Homing) technology. By integrating MSR™ and LACP (Link Aggregation Control Protocol), the JetNet series can enhance the link ability and increase the overall link capacity. Two or more Fast Ethernet connections are combined in order to increase the bandwidth and to create a resilient and redundant link.

### ***Seamless Ring Port Restoration™***

Seamless restoration is a new Korenix patented technology which can restore a failed ring without causing any loop problem, topology change and packet loss. With a 0 second restoration time, this mechanism eliminates any unstable status and guarantees the applications running non-stop.

***Rapid Dual Homing (RDH™) Technology***

Rapid Dual Homing is also the important feature of Korenix new generation Ring technology. It supports ring coupling with other vendors and with easy configuration and multiple redundancies, the failover time is much faster and the restoration time is zero ms. Uplinks can be auto detected and gathered into groups. In each group, uplinks are sorted into primary, secondary and standbys by their link speed. The uplink with the highest speed is more likely to be active path for data transmission. Link aggregation is also integrated into RDH™. An uplink connection can be a single link or several links aggregated as a trunk, which provides better redundancy and link capacity.

***TrunkRing™***

TrunkRing is a new feature in MSR™ which merges the two technologies of RSR™ and link aggregation. It takes advantages of aggregation to enhance the link redundancy, while increase the link speed. The ring will open only if all the aggregated links are broken. Link aggregation can be achieved by either, static trunk or LACP. Not all the link sections in a TrunkRing need to be the same. Ring links can be either symmetric or asymmetric. Some are a single path, and the others are aggregated by links where the number of links in a trunk group can be different. Users can enhance the link redundancy at different locations in accordance to the need. And the link with less speed is more likely to be used as the backup path for restoring the network to full play capacity.

***Link Aggregation Control Protocol***

Link Aggregation Control Protocol allows you grouping multiple Ethernet ports in parallel to increase the link bandwidth. The aggregated ports can be viewed as one physical port, so that the bandwidth is higher than just one single Ethernet port. The member ports of the same trunk group can balance the loading and backup with each other. The LACP feature is usually used when you need higher bandwidth for the backbone network. This is a cost-effective way for you to transfer much more data.

***Multi Powering Mechanism- User Manual, Forced and IEEE 802.3at LLDP Power over Ethernet***

Some of Legacy PD devices also feature user defined manual mode and forced powering mode to support non-standard PD devices without the PoE signature resistor for some WiMax systems, which are non-compliant with IEEE 802.3at LLDP Power over Ethernet.

For the new PoE standard – IEEE 802.3at, JetNet Switch implements Link Layer Discovery Protocol (LLDP) into the system for allowing power budget negotiation between PD devices while providing smart power budget control behavior.

***Auto Topology Discovery & Efficient Management through LLDP and JetView Pro i2NMS***

JetNet 5310G supports topology discovery or LLDP (IEEE 802.1AB Link Layer Discovery Protocol) function that can help users to discover multi-vendor's network devices on the same segment by an NMS system which supports LLDP function. With LLDP function, NMS can easily maintain the topology map, display port ID, port description, system description, VLAN ID and so on. Once a link failure happens, the topology changed events are updated to the NMS to help users easily maintain the network system. Like as the JetView Pro, not only supports topology discovery, it also delivers group IP assignment, firmware upgrade, configuration files backup/restore, SNMP MIB Browser /compile, **MSR™** group management and also allows user to export topology map to drawing file-JPEG, BMP, PNG or PDF for other application.

***Outstanding Management and Enhanced Security***

The JetNet 5310G provides various network control and security features to ensure the reliable and secure network connection. To optimize industrial network environment the switch supports advanced network features, such as Tag VLAN, IGMP Snooping, Quality of Service (QoS), Link Aggregation Control Protocol (LACP), Rate Control, etc. The PoE switch can be smartly configured through JetView, JetView Pro (Korenix's advanced management utility), Web Browser, SNMP, Telnet and RS-232 local console with its command like interface. The failure notifications are sent through e-mail, SNMP trap, Local/Remote system log, Multiple event alarm relay.

To avoid hacker's attacks and ensure the secure data transmission, JetNet 5310G series features DHCP client, DHCP server with IP and MAC binding, 802.1X Access Control, SSH for Telnet security, IP Access table, port security and many other security features.

## 1.2 Major Features

Korenix JetNet 5310G Switch have following features:

- 8 10/100 Base TX PoE ports and 2 Gigabit RJ/ SFP combo ports
- IEEE 802.3af 15.4W / IEEE 802.3at 30W High Power PoE
- 240W total power budget for High-power PoE camera
- SFP ports support 100/1000 Mbps with Digital Diagnostic Monitoring (DDM) to monitor long distance fiber quality
- All ports support Korenix patented RSR with 5ms recovery time, and MSR for up to 4 x 100M Rings plus 1 Gigabit Ring
- Advanced management by LACP/VLAN/Q-in-Q/Private VLAN/ GVRP/ QoS/ IGMP Snooping/Rate Control/ Online Multi-Port Mirroring/ Advanced DHCP server, Client
- Advanced Security system by Port Security, Access IP list, SSH and HTTPS Login
- Event Notification through E-mail, SNMP trap and SysLog
- IEEE 802.1AB LLDP and optional JetView Pro i<sup>2</sup>NMS software for auto-topology and group management
- Cisco-Like CLI, Web, SNMP/RMON for network Management
- Multiple event relay output for enhanced device alarm control
- Hi-Pot Isolation Protection for ports and power
- Industrial Heat dispersing design, -40~75°C wide operating temperature

**Note: The detail spec is listed in Appendix 5.1**

## 1.3 Package List

Korenix JetNet 5310G is shipped with following items:

- JetNet 5310G
- One DIN-Rail clip (attached to the switch)
- One RS-232 DB-9 to RJ-45 console cable
- Quick Installation Guide (QIG)

JetNet 5310G

DB-9 to RJ-45 Cable

QIG

If any of the above items is missing or damaged, please contact your local sales.

## **2 Hardware Installation**

This chapter includes hardware introduction, installation and configuration information.

Following topics are covered in this chapter:

### **2.1 Hardware Introduction**

Dimension

Panel Layout

Bottom View

Rear Side

### **2.2 Wiring Power Inputs**

### **2.3 Wiring the Relay Output (DO)**

### **2.4 Wiring the Digital Input (DI)**

### **2.5 Connecting the Surge/ Lighting Protection**

### **2.6 Wiring Ethernet Ports**

### **2.7 Wall-mounting Installation**

### 2.1 Hardware Introduction

#### Dimension –

JetNet 5310G w/o DIN Rail mounting kit: 95(W) x 127 (D) x 160(H)

JetNet 5310G w/ DIN Rail mounting kit: 95(W) x 136.2 (D) x 160(H)

**Panel Layout**

The front panel includes 8 x 10/100Mbps RJ-45 PoE ports, 2 x Gigabit Ethernet RJ-45/SFP socket ports, 1 RJ-45 for RS232 console, System diagnostic LEDs, Port LEDs, PoE status LEDs.

JetNet 5310G Appearance

**Bottom view**

The bottom side includes 2 4-pin terminal block connectors and 1 chassis grounding screw. One of 4-pin terminal block connectors is for power inputs, and the rest is for alarm relay output and digital input.

**Rear Side**

The rear side back panel attached DIN rail clip and one lighting screw to make connection with chassis ground and Switch inner lighting protection circuit. The product label is also stuck on the bottom side of DIN rail clip, in case if it is missed, please contact with your sales representative for product change.

**Korenix Technology Co., Ltd**

Model Name: JetNet 5310G  
 Default IP: 192.168.10.1

MAC Address:   
 001277600000

S/N:   
 JN2012040001

HW Version: 1.0  
 PSE model : Type 2, Alternative -A  
 PoE port: 100Base-TX, port 1~8  
 Apply Ethernet Cable: TIA/EIA Category 5 E, Category 6  
 Operating Temperature: PoE 15W x8 / 75°C

← Surge Ground Screw

Power Input: 802.3af - 46-57VDC, 2.5A Max.  
 802.3at - 50-57VDC, 2.1A Max.  
 Power Consumption with PD Loading (Max.): 802.3af - 2.4A@48VDC  
 802.3at - 2.2A@53VDC

 **RoHS**

Made in Taiwan

This label indicates that the type of PoE is Type-2 high power PSE and performs PoE powering by Alternative-A mode (1,2,3,6)

### 2.2 Wiring Power Inputs

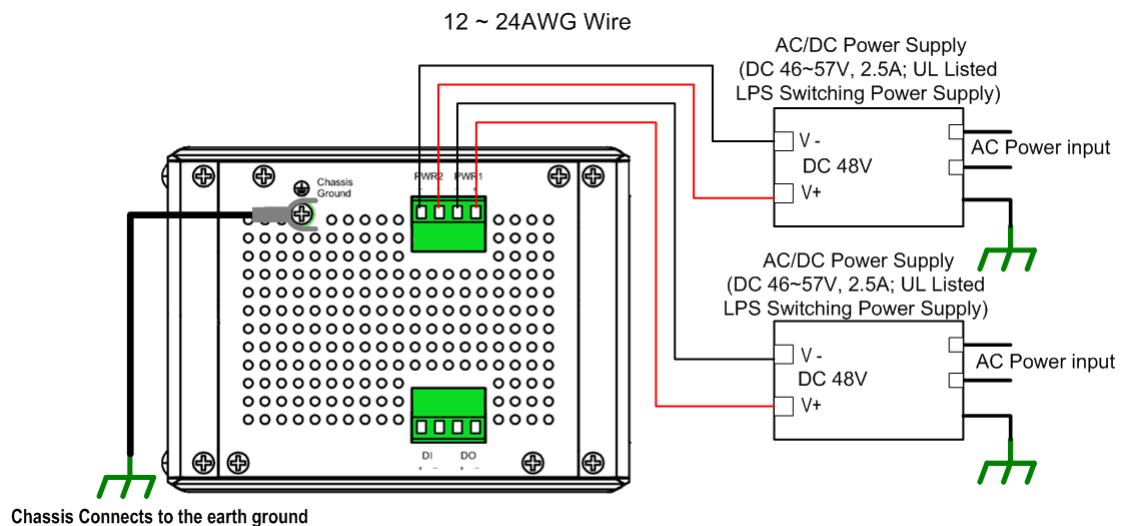

The Power input port is located at the bottom side, and provides 2 power input connections in one 4-pin removable terminal block. The power port support polarity reverse protection; the Switch won't start if wrong polarity applied. The wiring architecture please refers to below figure.

#### Wiring the Power Inputs

1. Insert the positive and negative wires into the V+ and V- contact on the terminal block connector.
2. Tighten the wire-clamp screws to prevent the power wires from being loosened.
3. Connect the power wires to suitable AC/DC Switching type power supply. The JetNet 5310G provides Power over Ethernet function and is compliant with IEEE802.3af/ IEEE802.3at standards; therefore, the input DC voltage should be in the range of DC 46V to DC 57V.

For the safety issue, turn off AC power input source before connecting the AC/DC Power supply module and the terminal block connectors. Besides, don't turn-on the source of AC/DC power module and make sure all connections were well done then power on the AC source to powering the Switch device. Otherwise, your screwdriver blade may inadvertently short your terminal connections to the grounded enclosure and cause damage.

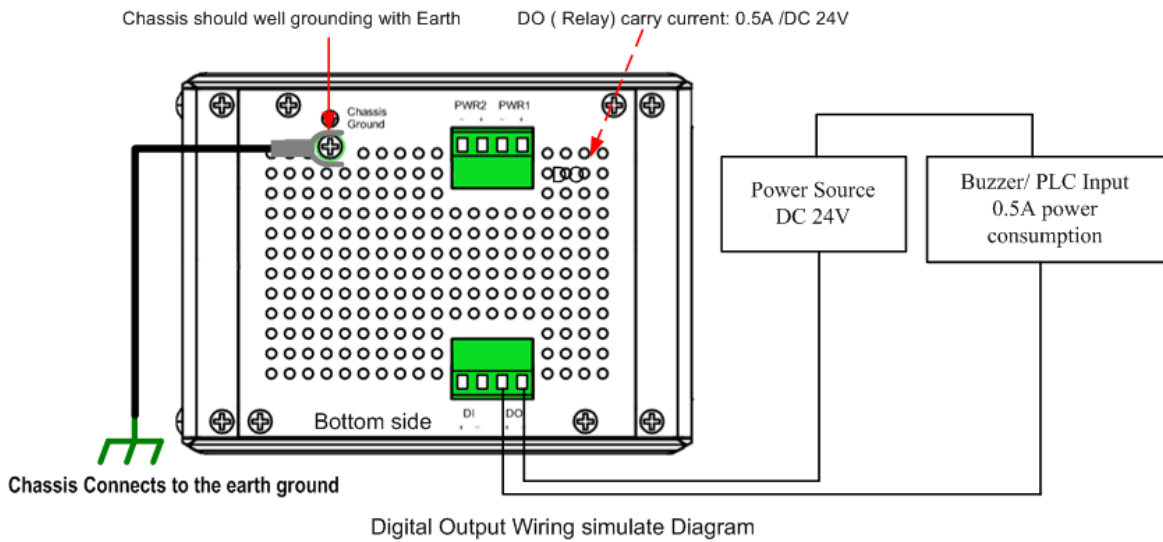

**Notes:** Use the **UL Listed LPS Power supply** with output Rating 46~57V Vdc, minimum 2.5A currents. Here, we recommended using DC 48V as the operating voltage. It is recommended to use 48vdc power supply.

### 2.3 Wiring the Relay Output (DO)

The relay output contacts are in the bottom side as shown on below figure. The relay output (DO) is controlled by the pre-defined operating rules. To activate relay output function, please refer to the CD User's Manual for more Relay Output management information.

**Note:** The relay contact only supports 0.5 A current, DC 24V. It is not recommended to apply voltage and current higher than the specifications.

## 2.4 Wiring the Digital Input (DI)

The Digital Input (D.I.) contacts are in the bottom side of the device as shown in below figure.

It accepts one external DC type signal input and can be configured to send alert message through Ethernet when the signal is changed. The signal may trigger and generated by external power switch, like as door open trigger switch for control cabinet.

**Note:** the DI accepts DC type signal and supports isolated input circuit with Digital High Level input DC 11V~30V and Digital Low Level input DC 0V~10V. Do not apply voltage that higher than the specification; it may cause internal circuit damage or a wrong action of DI.

## 2.5 Connecting the Surge /Lighting protection

There is one screw fixed on the rear side for lighting /surge protection; tighten and wire to chassis grounding to obtain better surge/ lighting immunity. But, do remember remove the surge grounding screw before to insulation/Hi-pot testing. In case you do not, the protectors may damage during the testing, and the lighting protection will malfunction.

**Note:** 1. Ensure the Surge/Lighting is well connecting with Chassis Grounding  
2. Remove the Surge /Lighting Screw, before performing Insulation / Hi-pot Testing.

Never install or work on/with the equipment or the cabling during the period of its lightning activity.

## 2.6 Wiring Fast Ethernet PoE Ports

The JetNet PoE Switch support 8 10/100Mbps Fast Ethernet ports with power over Ethernet (PoE) PSE function, and 2 Gigabit 10/100/1000Mbps RJ-45/SFP combo ports. Both of Gigabit combo ports provide SFP transceiver plug-in with first priority function.

### Fast Ethernet Ports

The Fast Ethernet ports (1~8) comply with IEEE 802.3af / IEEE802.3at function with 240 watts system power budget control function ( enabled from firmware v1.2a); the PoE ports support alternative-A type powering method, and forward power through the RJ-45 conductors 1, 2, 3 and 6. If the power device (PD) is not fully compliant with IEEE 802.3af / IEEE 802.3at, then it will not be powering. So, before connecting the PD device, please ensure the PD you have bought is compliant with PoE standard. The RJ-45 plug's

conductor pin assignment shows as following table for your reference.

RJ-45 conductor	Type of Signal	Polarity of power	Note
1	RxD +	V -	Alternative-A
2	RxD -	V -	Alternative-A
3	TxD +	V+	Alternative-A
6	TxD -	V+	Alternative-A

Note: The PD device should accept power from either 1,2,3,6 (data pairs) or 4,5,7,8 (spare pairs); for the detail information, please refer to IEEE 802.3at / IEEE 802.3af Power over Ethernet standard.

### Gigabit Ethernet /SFP combo port

The JetNet 5310G provides 2 Gigabit RJ-45/ SFP combo ports that with different link speed – 10Mbps, 100Mbps, 1000Mbps, and compliant with the standards of IEEE 802.3 10Base-T, IEEE 82.3u 100Base-TX, IEEE 8023.u 100Base-FX, IEEE 802.3ab 1000Base-T, and IEEE 802.3z Gigabit fiber.

The combo ports support SFP transceiver plug-in high priority function; thus, don't connect Ethernet RJ-45 and insert SFP transceiver at the same time; it will cause the port being activated in wrong status.

The SFP ports also provide Digital Diagnostic Monitoring function, it can assist user to monitor the quality of optical signal, and diagnose the transmission of fiber. This function is only available for Korenix certified DDM SFP transceiver, and does not support third party transceiver that may not fully comply with MSA SFP transceiver standard.

By the DDM function, user can get real information including the strength of received optical signal, launched optical signal and current operating temperature of SFP transceiver, and the specification of transceiver.

The following diagram shows the information captured from WEB user interface.

SFP DDM								
Port	SFP Scan / Eject	SFP DDM	Temperature (°C)		Tx Power (dBm)		Rx Power (dBm)	
			Current	Range	Current	Range	Current	Range
9	Scan	Disable	--	--	--	--	--	--
10	Eject	Disable	40.00	0.00 ~ 80.00	-6.0	-9.0 ~ -3.5	-31.5	-15.9 ~ -3.5

Range: the specification of Korenix defined.

Current: actual value read from SFP transceiver.

Tx Power (dBm): optical strength of received.

Rx Power (dBm): optical strength of launched.

**Note: The Ethernet Switch has to use UL recognized fiber transceiver with Class 1 Laser/LED Diode.**

**Note: It is recommended to not plug-in SFP fiber transceiver and link up RJ-45 port at the same time, it might cause the connection does not working properly.**

## 2.7 DIN Rail mounting Installation

The DIN-Rail clip is already screwed tight on the rear side of JetNet Switch when shipping. If the DIN-Rail clip is not screwed on the rear side panel, please contact your distributor to get the DIN rail clip set. The DIN rail clip supports EN50022 standard. The diagram following includes the dimension of EN50022 DIN rail for your reference.

The Switch should install and used at Restricted Access Location area, like as the control room or control cabinet. Besides, the device's surface temperature may cause damage while the Power over Ethernet function is enabled and under working, at the ambient temperature -75°C. Therefore, the device should install at the restricted location, like as Control cabinet to prevent any damage.

Follow the steps below to mount JetNet Managed Switch to the DIN-Rail track:

1. First, insert the DIN-Rail track upper side into the upper end of DIN-Rail clip.
2. Lightly push the bottom of DIN-Rail clip into the track.
3. Check if DIN-Rail clip is tightly attached to the EN50022 Rail track.
4. To remove JetNet Switch from the track, reverse the steps above.

**Notes:** 1. The DIN Rail should compliant with DIN EN50022 standard. Using wrong DIN rail may cause unsafe installation.

2. For UL Safety consideration- the equipment is designed for in building installation only and is not intended to be connected to exposed (outside plant) networks.

## 3 Preparation for Management

JetNet Industrial Managed PoE Switch provides both in-band and out-band configuration methods. You can configure the switch via RS232 console cable if you don't attach your admin PC to your network, or if you lose network connection to your JetNet PoE Managed Switch. This is so-called out-band management. It wouldn't be affected by network performance.

The in-band management means you can remotely manage the switch via the network. You can choose Telnet or Web-based management. You just need to know the device's IP address and you can remotely connect to its embedded HTTP web pages or Telnet console.

Following topics are covered in this chapter:

### 3.1 Preparation for Serial Console

### 3.2 Preparation for Web Interface

### 3.3 Preparation for Telnet console

## 3.1 Preparation for Serial Console

In the unit package, Korenix attached one RJ-45 to RS-232 DB-9 console cable. Please attach RS-232 DB-9 connector to your PC's COM port, connect RJ-45 connector to the Console port of the JetNet PoE Managed Switch. If the serial cable is lost, please follow the serial console cable PIN assignment to find one. (Refer to the appendix).

1. Go to Start -> Program -> Accessories -> Communication -> Hyper Terminal
2. Give a name to the new console connection.
3. Choose the COM name
4. Select correct serial settings. The serial settings of JetNet PoE Managed Switches are as below:

Baud Rate: 9600 / Parity: None / Data Bit: 8 / Stop Bit: 1

5. After connected, you can see Switch login request.
6. Login the switch. The default username is "admin", password, "admin".

```
Booting...
      Sun Jan  1 00:00:00 UTC 2006
Switch login: admin
Password:

JetNet 5310G (version 1.1.5-20100414-11:04:13).

Switch>
```

## 3.2 Preparation for Web Interface

JetNet Managed PoE Switch provides HTTP Web Interface and Secured HTTPS Web Interface for web management.

### 3.2.1 Web Interface

Korenix web management page is developed by CGI (Common Gateway Interface). It allows you to use a standard web-browser such as Microsoft Internet Explorer, or Mozilla, to configure and interrogate the switch from anywhere on the network.

Before you attempt to use the embedded web interface to manage switch operation, verify that your JetNet Managed PoE Switch is properly installed on your network and that every PC on this network can access the switch via the web browser.

1. Verify that your network interface card (NIC) is operational, and that your operating system supports TCP/IP protocol.
2. Wire DC power to the switch and connect your switch to your computer.
3. Make sure that the switch default IP address is 192.168.10.1.
4. Change your computer IP address to 192.168.10.2 or other IP address which is located in the 192.168.10.x (Network Mask: 255.255.255.0) subnet.
5. Switch to DOS command mode and ping 192.168.10.1 to verify a normal response time.

Launch the web browser and Login.

6. Launch the web browser (Internet Explorer or Mozilla Firefox) on the PC.
7. Type **http://192.168.10.1** (or the IP address of the switch). And then press **Enter**.
8. The login screen will appear next.
9. Key in user name and the password. Default user name and password are both **admin**.

#### Welcome to the DinPoeSwitch-8plus2G

Name

Password

Click on **Enter** or **Login**. The Welcome page of the web-based management interface will then appear.

Welcome to the DinPoeSwitch-8plus2G Industrial Managed Switch

Help

System Name	Switch
System Location	
System Contact	
System OID	1.3.6.1.4.1.24062.2.3.9
System Description	DinPoeSwitch-8plus2G Industrial Managed Ethernet Switch
Firmware Version	2.0_b13-20161012-15:29:10
Device Mac	001277618787

Apply

Once you enter the web-based management interface, you can freely change the JetNet’s IP address to fit your network environment.

**Note 1:** The Web UI connection session of JetNet managed Switch will be logged out automatically if you don’t give any input after 30 seconds. After logged out, you should re-login and key in correct user name and password again.

### 3.2.2 Secured Web Interface

Korenix web management page also provides secured management HTTPS login. All the configuration commands will be secured and will be hard for the hackers to sniff the login password and configuration commands.

Launch the web browser and Login.

1. Launch the web browser (Internet Explorer or Mozilla Firefox) on the PC.
2. Type **https://192.168.10.1** (or the IP address of the switch). And then press **Enter**.
3. The popup screen will appear and request you to trust the secured HTTPS connection distributed by JetNet PoE Managed Switch first. Click “**Yes**” to trust it. (sample of JetNet 5010G)

4. The login screen will appear next. (sample of JetNet 5010G, IP address 192.168.0.48)

5. Key in the user name and the password. The default user name and password is **admin**.
6. Click on **Enter** or **OK**. Welcome page of the web-based management interface will then appear.
7. Once you enter the web-based management interface, all the commands you see are the same as what you see by HTTP login.

### 3.3 Preparation for Telnet Console

#### 3.3.1 Telnet

Korenix JetNet managed Switch supports Telnet console. You can connect to the switch by Telnet and the command lines are the same as what you see by RS232 console port. Below are the steps to open Telnet connection to the switch.

1. Go to Start -> Run -> cmd. And then press **Enter**
2. Type the **Telnet 192.168.10.1** (or the IP address of the switch). And then press **Enter**

#### 3.3.2 SSH (Secure Shell)

Korenix JetNet managed Switch also support SSH console. You can remotely connect to the switch by command line interface. The SSH connection can secure all the configuration commands you sent to the switch.

SSH is a client/server architecture while the Switch is the SSH server. When you want to make SSH connection with the switch, you should download the SSH client tool first.

##### SSH Client

There are many free, sharewares, trials or charged SSH clients you can find on the internet. For example, PuTTY is a free and popular Telnet/SSH client. We'll use this tool to demonstrate how to login JetNet by SSH. Note: *PuTTY is copyright 1997-2006 Simon Tatham.*

##### Download PuTTY:

<http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html>

The copyright of **PuTTY**

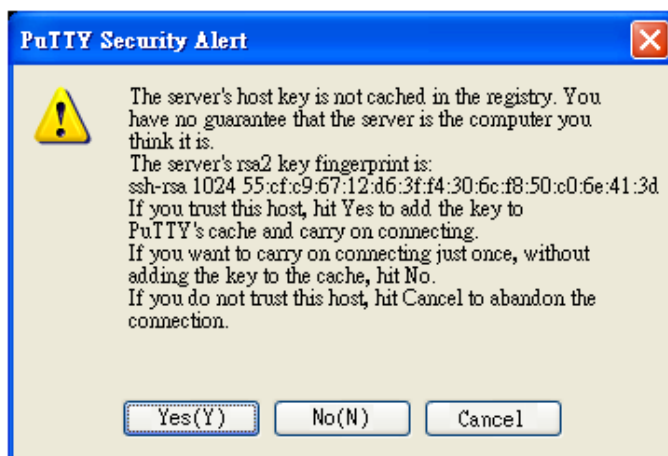

#### 1. Open SSH Client/PuTTY

In the **Session** configuration, enter the **Host Name** (IP Address of your JetNet switch) and **Port number** (default = 22). Choose the **“SSH”** protocol. Then click on **“Open”** to start the SSH session console.

2. After click on **Open**, then you can see the cipher information in the popup screen. Press **Yes** to accept the Security Alert.

3. After few seconds, the SSH connection to JetNet Switch is opened. You can see the login screen as the below figure- sample of JetNet switch for reference. (sample of IP address 192.168.10.1)

```
192.168.10.1 - PuTTY
login as: admin
admin@192.168.10.1's password:
JetNet6810G (version 1.0.27-20111025-11:15:58).
Copyright 2006-2011 Korenix Technology Co., Ltd.
Switch> █
```

4. Type the Login Name and its Password. The default Login Name and Password are **admin / admin**.
5. All the commands you see in SSH are the same as the CLI commands you see via RS232 console. The next chapter will introduce in detail how to use command line to configure the switch.

## **4 Feature Configuration**

This chapter explains how to configure JetNet Managed software features. There are four ways to access the switch: Serial console, Telnet, Web browser and SNMP.

JetNet Managed Switch provides both in-band and out-band configuration methods. You can configure the switch via RS232 console cable if you don't attach your admin PC to your network, or if you lose the network connection to your JetNet switch. This is so-called out-band management. It wouldn't be affected by the network performance.

The in-band management means you can remotely manage the switch via the network. You can choose Telnet or Web-based management. You just need to know the device's IP address. Then you can remotely connect to its embedded HTML web pages or Telnet console.

Korenix web management page is developed by CGI (Common Gateway Interface). It allows you to use a standard web-browser such as Microsoft Internet Explorer, or Mozilla, to configure and interrogate the switch from anywhere on the network.

Following topics are covered in this chapter:

- 4.1 Command Line Interface (CLI) Introduction
- 4.2 Basic Setting
- 4.3 Port Configuration
- 4.4 Power over Ethernet
- 4.5 Network Redundancy
- 4.6 VLAN
- 4.7 Private VLAN
- 4.8 Traffic Prioritization
- 4.9 Multicast Filtering
- 4.10 SNMP
- 4.11 Security
- 4.12 Warning
- 4.13 Monitor and Diag
- 4.14 Device Front Panel
- 4.15 Save
- 4.16 Logout

## 4.1 Command Line Interface Introduction

The Command Line Interface (CLI) is the user interface to the switch's embedded software system. You can view the system information, show the status, configure the switch and receive a response back from the system by keying in a command.

There are some different command modes. Each command mode has its own access ability, available command lines and uses different command lines to enter and exit. These modes are User EXEC, Privileged EXEC, Global Configuration, (Port/VLAN) Interface Configuration modes.

**User EXEC mode:** As long as you login the switch by CLI. You are in the User EXEC mode. You can ping, telnet remote device, and show some basic information.

Type **enable** to enter next mode, **exit** to logout. **?** to see the command list

<b>Switch&gt;</b>	
enable	Turn on privileged mode command
exit	Exit current mode and down to previous mode
list	Print command list
ping	Send echo messages
quit	Exit current mode and down to previous mode
show	Show running system information
telnet	Open a telnet connection
traceroute	Trace route to destination

**Privileged EXEC mode:** Press enable in the User EXEC mode, then you can enter the Privileged EXEC mode. In this mode, the system allows you to view current configuration, reset default, reload switch, show system information, save configuration...and enter the global configuration mode.

Type **configure terminal** to enter next mode, **exit** to leave. **?** to see the command list

Switch#	
archive	Manage archive files
clear	Reset functions
clock	Configure time-of-day clock
configure	Configuration from vty interface
copy	Copy from one file to another
debug	Debugging functions (see also 'undebug')
disable	Turn off privileged mode command
dot1x	IEEE 802.1x standard access security control
end	End current mode and change to enable mode
exit	Exit current mode and down to previous mode
hardware	hardware function
list	Print command list
no	Negate a command or set its defaults
pager	Terminal pager
ping	Send echo messages
quit	Exit current mode and down to previous mode
reboot	Reboot system
reload	copy a default-config file to replace the current one
show	Show running system information
telnet	Open a telnet connection
terminal	Set terminal line parameters
traceroute	Trace route to destination
write	Write running configuration to memory, network, or terminal

**Global Configuration Mode:** Press **configure terminal** in privileged EXEC mode. You can then enter global configuration mode. In global configuration mode, you can configure all the features that the system provides you.

Type **interface IFNAME/VLAN** to enter interface configuration mode, **exit** to leave. **?** to see the command list.

Available command lists of global configuration mode.

Switch(config)#	
administrator	Administrator account setting
arp	Set a static ARP entry
clock	Configure time-of-day clock
default	Set a command to its defaults
dot1x	IEEE 802.1x standard access security control
end	End current mode and change to enable mode
ethertype	Ethertype
exit	Exit current mode and down to previous mode
gmrp	GMRP protocol
gvrp	GARP VLAN Registration Protocol
hostname	Set system's network name
interface	Select an interface to configure
ip	IP information
lacp	Link Aggregation Control Protocol
list	Print command list
lldp	Link Layer Discovery Protocol
log	Logging control
mac-address-table	mac address table
mirror	Port mirroring
modbus	Modbus TCP Slave
multiple-super-ring	Configure Multiple Super Ring
nameserver	DNS Server
no	Negate a command or set its defaults
ntp	Configure NTP
poe	Configure power over ethernet
ptpd	IEEE1588 Precision Time Protocol
qos	Quality of Service (QoS)
relay	relay output type information
router	Enable a routing process
sfp	Small form-factor pluggable
smtp-server	SMTP server configuration
snmp-server	the SNMP server
spanning-tree	the spanning tree algorithm
trunk	Trunk group configuration
vlan	Virtual LAN
warning-event	Warning event selection
write-config	Specify config files to write to
Switch(config)#	

**(Port) Interface Configuration:** Press **interface IFNAME** in global configuration mode. You can then enter interface configuration mode. In this mode, you can configure port settings.

The port interface name for fast Ethernet port 1 is fa1,... fast Ethernet 7 is fa7, fast Ethernet port 8 is fa8.. Gigabit Ethernet port 9 is gi9 and port 10 is gi10. Type the interface name accordingly when you want to enter certain interface configuration mode.

Type **“exit”** to leave current level.

Type **“?”** to see the command list

Available command lists of the global configuration mode.

Switch(config)# interface fa1	
Switch(config-if)#	
acceptable	Configures the 802.1Q acceptable frame types of a port.
auto-negotiation	Enables auto-negotiation state of a given port
description	Interface specific description
dot1x	IEEE 802.1x standard access security control
duplex	Specifies the duplex mode of operation for a port
end	End current mode and change to enable mode
exit	Exit current mode and down to previous mode
flowcontrol	Sets the flow-control value for an interface
garp	General Attribute Registration Protocol
ingress	802.1Q ingress filtering features
lacp	Link Aggregation Control Protocol
list	Print command list
loopback	Specifies the loopback mode of operation for a port
mdix	Configure mdix state of a given port
mtu	Specifies the MTU on a port.
no	Negate a command or set its defaults
poe	Configure power over ethernet
qos	Quality of Service (QoS)
quit	Exit current mode and down to previous mode
rate-limit	Rate limit configuration
sfp	Small form,-factor pluggable
shutdown	Shutdown the selected interface
spanning-tree	the spanning-tree protocol
speed	Specifies the speed of a Fast Ethernet port or a Gigabit Ethernet port.
switchport	Set switching mode characteristics

**(VLAN) Interface Configuration:** Press **interface VLAN VLAN-ID** in global configuration mode. You can then enter VLAN interface configuration mode. In this mode, you can configure the settings for the specific VLAN.

The VLAN interface name of VLAN 1 is VLAN 1, VLAN 2 is VLAN 2...

Type **exit** to leave the mode. Type **?** To see the available command list.

The command lists of the VLAN interface configuration mode.

```
Switch(config)# interface vlan 1
Switch(config-if)#
  description  Interface specific description
  end          End current mode and change to enable mode
  exit        Exit current mode and down to previous mode
  ip          Interface Internet Protocol config commands
  list        Print command list
  no         Negate a command or set its defaults
  quit       Exit current mode and down to previous mode
  shutdown   Shutdown the selected interface
```

Summary of the 5 command modes.

Command Mode	Main Function	Enter and Exit Method	Prompt
User EXEC	This is the first level of access. User can ping, telnet remote device, and show some basic information	Enter: <b>Login</b> successfully Exit: <b>exit</b> to logout. Next mode: Type <b>enable</b> to enter privileged EXEC mode.	Switch>
Privileged EXEC	In this mode, the system allows you to view current configuration, reset default, reload switch, show system information, save configuration...and enter global configuration mode.	Enter: Type <b>enable</b> in User EXEC mode. Exec: Type <b>disable</b> to exit to user EXEC mode. Type <b>exit</b> to logout Next Mode: Type <b>configure terminal</b> to enter global configuration command.	Switch#
Global configuration	In global configuration mode, you can configure all the features that the system provides you	Enter: Type <b>configure terminal</b> in privileged EXEC mode Exit: Type <b>exit</b> or <b>end</b> or press <b>Ctrl-Z</b> to exit. Next mode: Type <b>interface IFNAME/ VLAN VID</b> to enter interface configuration mode	Switch(config)#
Port Interface configuration	In this mode, you can configure port related settings.	Enter: Type <b>interface IFNAME</b> in global configuration mode. Exit: Type <b>exit</b> or <b>Ctrl+Z</b> to global configuration mode. Type <b>end</b> to privileged EXEC mode.	Switch(config-if)#

VLAN Interface Configuration	In this mode, you can configure settings for specific VLAN.	Enter: Type <b>interface VLAN VID</b> in global configuration mode. Exit: Type <b>exit</b> or <b>Ctrl+Z</b> to global configuration mode. Type <b>end</b> to privileged EXEC mode.	Switch(config-vlan)#
------------------------------	---	---	----------------------

Here are some useful commands for you to see these available commands. Save your time in typing and avoid typing error.

? To see all the available commands in this mode. It helps you to see the next command you can/should type as well.

```
Switch(config)# interface (?)
IFNAME  Interface's name
vlan    Select a vlan to configure
```

(Character)? To see all the available commands starts from this character.

```
Switch(config)# a?
access-list  Add an access list entry
administrator Administrator account setting
arp          Set a static ARP entry
```

The tab key helps you to input the command quicker. If there is only one available command in the next, clicking on tab key can help to finish typing soon.

```
Switch# co (tab) (tab)
Switch# configure terminal

Switch(config)# ac (tab)
Switch(config)# access-list
```

Ctrl+C To stop executing the unfinished command.

Ctrl+S To lock the screen of the terminal. You can't input any command.

Ctrl+Q To unlock the screen which is locked by Ctrl+S.

Ctrl+Z To exit configuration mode.

Alert message when multiple users want to configure the switch. If the administrator is in configuration mode, then the Web users can't change the settings. JetNet Managed Switch allows only one administrator to configure the switch at a time.

## 4.2 Basic Setting

The Basic Setting group provides you to configure switch information, IP address and user name/Password of the system. It also allows you to do firmware upgrade, backup and restore configuration, reload factory default, and reboot the system.

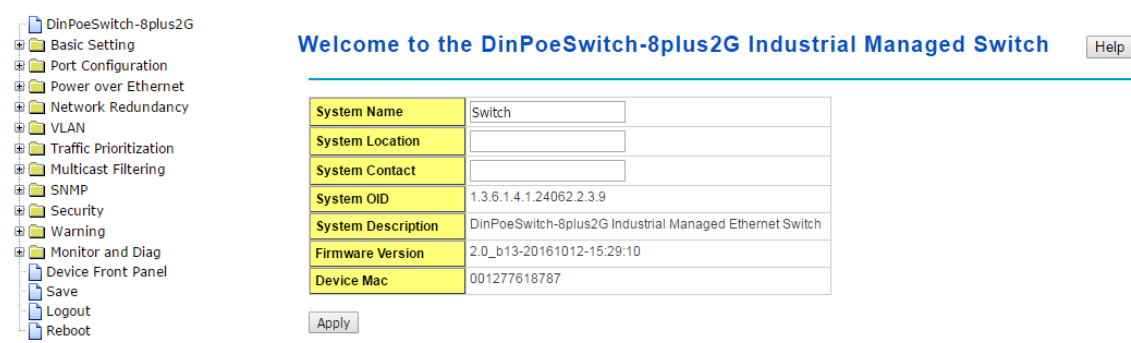

Following commands are included in this group:

- 4.2.1 Switch Setting
- 4.2.2 Admin Password
- 4.2.3 IP Configuration
- 4.2.4 Time Setting
- 4.2.5 DHCP Server
- 4.2.6 Backup and Restore
- 4.2.7 Firmware Upgrade
- 4.2.8 Factory Default
- 4.2.9 System Reboot
- 4.2.10 CLI Commands for Basic Setting

### 4.2.1 Switch Basic Setting

You can assign System name, Location, Contact and view system information.

Below Figure 4.2.1.1 – Web UI of the Switch Basic Setting

**System Name:** You can assign a name to the device. The available characters you can input is 64. After you configure the name, CLI system will select the first 12 characters as the name in CLI system.

**System Location:** You can specify the switch’s physical location here. The available characters you can input are 64.

**System Contact:** You can specify contact people here. You can type the name, mail address or other information of the administrator. The available characters you can input are 64.

**System OID:** The SNMP object ID of the switch. You can follow the path to find its private MIB in MIB browser. **(Note:** When you attempt to view private MIB, you

should compile private MIB files into your MIB browser first.)

**System Description:** the name of this managed product.

**Firmware Version:** Display the firmware version installed in this device.

**MAC Address:** Display unique hardware address (MAC address) assigned by the manufacturer.

Once you finish the configuration, click on **Apply** to apply your settings.

**Note:** Always remember to select **Save** to save your settings. Otherwise, the settings you made will be lost when the switch is powered off.

#### 4.2.2 Admin Password

You can change the user name and the password here to enhance security

Figure 4.2.2.1 Web UI sample of the Admin Password

**User name:** You can key in new user name here. The default setting is **admin**.

**Password:** You can key in new password here. The default setting is **admin**.

**Confirm Password:** You need to type the new password again to confirm it.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

Figure 4.2.2.2 Popup alert window for Incorrect Username.

#### 4.2.3 IP Configuration

This function allows users to configure the switch’s IP address settings. Below figure is the UI of IP configuration.

IP Configuration

DHCP Client

IPv4 Configuration

IP Address	<input type="text" value="192.168.10.150"/>
Subnet Mask	<input type="text" value="255.255.255.0"/>
Default Gateway	<input type="text" value="192.168.10.100"/>
DNS Server 1	<input type="text"/>
DNS Server 2	<input type="text"/>

**DHCP Client:** You can select to **Enable** or **Disable** DHCP Client function. When DHCP Client function is enabled, an IP address will be assigned to the switch from the network’s DHCP server. In this mode, the default IP address will therefore be replaced by the one assigned by DHCP server. If DHCP Client is disabled, then the IP address that you specified will be used instead.

**IP Address:** You can assign the IP address reserved by your network for your JetNet. If DHCP Client function is enabled, you don’t need to assign an IP address to the JetNet, as it will be overwritten by DHCP server and shown here. The default IP is 192.168.10.1.

**Subnet Mask:** You can assign the subnet mask for the IP address here. If DHCP Client function is enabled, you don’t need to assign the subnet mask. The default Subnet Mask is 255.255.255.0.

**Note:** In the CLI, we use the enabled bit of the subnet mask to represent the number displayed in web UI. For example, 8 stands for 255.0.0.0; 16 stands for 255.255.0.0; 24 stands for 255.255.255.0.

**Default Gateway:** You can assign the gateway for the switch here. The default gateway is 192.168.10.254.

**Note:** In CLI, we use 0.0.0.0/0 to represent for the default gateway.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

**IPv6 Configuration** –An IPv6 address is represented as eight groups of four hexadecimal digits, each group representing 16 bits (two octets). The groups are separated by colons (:), and the length of IPv6 address is 128bits. An example of an IPv6 address is: 2001:0db8:85a3:0000:0000:8a2e:0370:7334.

The default IP address of JetNet Managed Switch is fe80:0:0:0:212:77ff:fe61:8787, and the Leading zeroes in a group may be omitted. Thus, the example address may be written as: fe80::212:77ff:fe61:8787

**IPv6 Configuration**

IPv6 Address	Prefix Length
<input type="text"/>	<input type="text"/>

IPv6 Default Gateway
<input type="text"/>

IPv6 Address
<input type="checkbox"/> fe80::212:77ff:fe61:8787/64

**IPv6 Address:** typing new IPv6 address in this field.

**Prefix Length:** the size of subnet or network, and it equivalent to the subnetmask, but written in different. The default subnet mask length is 64bits, and written in decimal value - 64.

**Add:** after add new IPv6 address and prefix, don't forget click icon -“Add” to apply new address to system.

**Remove:** select existed IPv6 address and click icon -“Remove” to delete IP address.

**Reload:** refresh and reload IPv6 address listing.

**IPv6 Neighbor Table:** shows the IPv6 address of neighbor, connected interface, MAC address of remote IPv6 device, and current state of neighbor device.

**IPv6 Neighbor Table**

Neighbor	Interface	MAC Address	State
<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

The system will update IPv6 Neighbor Table automatically, and user also can click the icon “Reload” to refresh the table.

**4.2.4 Time Setting**

Time Setting source allow user to set the time manually or through NTP server. Network Time Protocol (NTP) is used to synchronize computer clocks on the internet. You can configure NTP settings here to synchronize the clocks of several switches on the network. Below figure is similar as JetNet Switch.

Time Setting Help

Current Time	Yr <input type="text" value="2016"/> Mon <input type="text" value="11"/> Day <input type="text" value="18"/> Hr <input type="text" value="15"/> Mn <input type="text" value="8"/> Sec <input type="text" value="12"/>
	<span style="border: 1px solid gray; padding: 2px 5px;">Get PC Time</span>
Time Zone	(GMT) Greenwich Mean Time: Dublin, Edinburgh, Lisbon, London ▼

Once you finish your configuration, click on **Apply** to activate your configuration.

### 4.2.5 DHCP Server

You can select to **Enable** or **Disable** DHCP Server function. *JetNet switch* will assign a new IP address to link partners.

#### DHCP Server configuration

After selecting to enable DHCP Server function, type in the Network IP address for the DHCP server IP pool, Subnet Mask, Default Gateway address and Lease Time for client.

Once you have finished the configuration, click **Apply** to activate the new configuration.

#### Excluded Address:

You can type a specific address into the **IP Address field** for the DHCP server reserved IP address.

The IP address that is listed in the **Excluded Address List Table** will not be assigned to the network device. Add or remove an IP address from the **Excluded Address List** by clicking **Add** or **Remove**.

**Manual Binding:** JetNet Switch provides a MAC address and IP address binding and removing function. You can type in the specified IP and MAC address, and then click **Add** to add a new MAC&IP address binding rule for a specified link partner, like PLC or any device without **DHCP client** function. To remove from the binding list, just select the rule to remove and click **Remove**.

#### 4.2.6 Backup and Restore

With Backup command, you can save current configuration file saved in the switch's flash to admin PC or TFTP server. This will allow you to go to **Restore** command later to restore the configuration file back to the switch. Before you restore the configuration file, you must place the backup configuration file in the PC or TFTP server. The switch will then download this file back to the flash.

There are 2 modes for users to backup/restore the configuration file, Local File mode and TFTP Server mode.

**Local File** mode: In this mode, the switch acts as the file server. Users can browse the target folder and then type the file name to back up the configuration. Users can also browse the target folder and select existed configuration file to restore the configuration back to the switch. This mode is only provided by Web UI while CLI is not supported.

**TFTP Server** mode: In this mode, the switch acts as TFTP client. Before you do so, make sure that your TFTP server is ready. Then please type the IP address of TFTP Server and Backup configuration file name. This mode can be used in both CLI and Web UI.

**TFTP Server IP Address:** You need to key in the IP address of your TFTP Server here.

**Backup/Restore File Name:** Please type the correct file name of the configuration file.

**Configuration File:** The configuration file of the switch is a pure text file. You can open it by word/txt read file. You can also modify the file, add/remove the configuration settings, and then restore back to the switch.

**Startup Configuration File:** After you saved the running-config to flash, the new settings will be kept and work after power cycle. You can use *show startup-config* to view it in CLI. The Backup command can only backup such configuration file to your PC or TFTP server.

**Technical Tip:**

**Default Configuration File:** The switch provides the default configuration file in the system. You can use *Reset* button, *Reload* command to reset the system.

**Running Configuration File:** The switch's CLI allows you to view the latest settings running by the system. The information shown here is the settings you set up but haven't saved to flash. The settings not yet saved to flash will not work after power recycle. You can use *show running-config* to view it in CLI.

**Local Files**

Load Settings from File	選擇檔案 未選擇任何檔案	Upload
Save Settings to File	Save...	

**TFTP**

IP	<input type="text"/>	
File Name	DinPoeSwitch-8plus2G-00	
Load/Save Settings	Load ▾ Load Save	Submit

**Note** that the folders of the path to the target file do not allow you to input space key.

**Note:** point to the wrong file will cause the entire configuration missed

**4.2.7 Firmware Upgrade**

In this section, you can update the latest firmware for your switch. Korenix provides the latest firmware in Korenix Web site. The new firmware may include new features, bug fixes or other software changes. We'll also provide the release notes for the update as well. For technical viewpoint, we suggest you use the latest firmware before installing the switch to the customer site.

**Note that the system will be automatically rebooted after you finished upgrading new firmware. Please remind the attached network users before you perform this function.**

**Firmware Upgrade** Help

**Local file**

Select File	選擇檔案 未選擇任何檔案
Upgrade	Cancel

**TFTP**

IP	<input type="text"/>
File Name	<input type="text"/>
Upgrade	Cancel

There are 2 modes for users to backup/restore the configuration file, Local File mode and TFTP Server mode.

**Local File** mode: In this mode, the switch acts as the file server. Users can browse

the target folder and then type the file name to back up the configuration. Users also can browse the target folder and select the existed configuration file to restore the configuration back to the switch. This mode is only provided by Web UI while CLI is not supported.

**TFTP mode:** In this mode, the switch acts as the TFTP client. Before you do so, make sure that your TFTP server is ready. And then please type the IP address of TFTP Server IP address. Then click on Upgrade to start the process. This mode can be used in both CLI and Web UI.

**IP:** You need to key in the IP address of your TFTP Server here.

**File Name:** The file name of the new firmware.

The UI also shows you the current firmware version and built date of current firmware. Please check the version number after the switch is rebooted.

After finishing transmitting the firmware, the system will copy the firmware file and replace the firmware in the flash. The CLI show ..... until the process is finished.

**Factory Default**

In this section, you can reset all the configurations of the switch to default setting. Click on **Reset** the system will then reset all configurations to default setting. The system will show you popup message window after finishing this command. Default setting will work after rebooting the switch.

Figure- 4.2.8.1 The main screen of the Factory Default

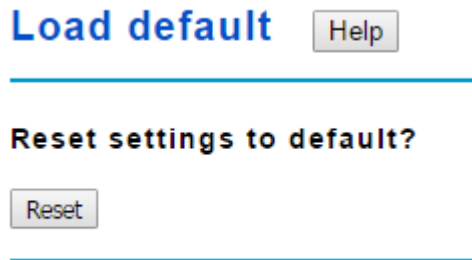

Figure 4.2.8.2 Popup alert screen to confirm the command. Click on **Yes** to start it.

Figure 4.2.8.3 Popup message screen to show you that have done the command. Click on **OK** to close the screen. Then please go to **Reboot** page to reboot the switch.

**Please reboot the switch to reload default settings except IP address.**

Click on **OK**. The system will then auto reboot the device.

Note: If you already configured the IP of your device to other IP address, when you use this command by CLI and Web UI, our software will not reset the IP address to default IP. The system will remain the IP address so that you can still connect the switch via the network.

#### 4.2.8 System Reboot

System Reboot allows you to reboot the device. Some of the feature changes require you to reboot the system. Click on **Reboot** to reboot your device.

**Note:** Remember to click on **Save** button to save your settings. Otherwise, the settings you made will be gone when the switch is powered off.

Figure 4.2.9.1 Main screen for Rebooting. Click on Yes. Then the switch will be rebooted immediately.

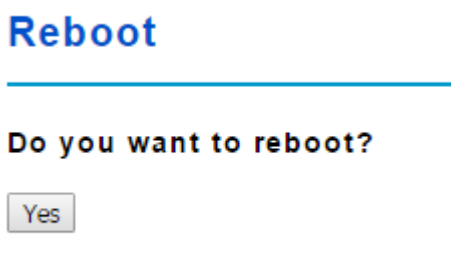

Figure 4.2.9.2 screen appears when rebooting the switch..

### Rebooting....Please wait!

### 4.3 Port Configuration

Port Configuration group enables you to enable/disable port state, or configure port auto-negotiation, speed, and duplex, flow control, rate limit control and port aggregation settings. It also allows you to view port status and aggregation information.

Following commands are included in this group:

- 4.3.1 Port Control
- 4.3.2 Port Status
- 4.3.3 Rate Control
- 4.3.4 Port Trunking
- 4.3.5 Command Lines for Port Configuration

#### 4.3.1 Port Control

Port Control commands allow you to enable/disable port state, or configure the port auto-negotiation, speed, duplex and flow control.

**Port Control**

Port	State	Speed/Duplex	Flow Control	Description
1	Enable ▼	AutoNegotiation ▼	Disable ▼	
2	Enable ▼	AutoNegotiation ▼	Disable ▼	
3	Enable ▼	AutoNegotiation ▼	Disable ▼	
4	Enable ▼	AutoNegotiation ▼	Disable ▼	
5	Enable ▼	AutoNegotiation ▼	Disable ▼	
6	Enable ▼	AutoNegotiation ▼	Disable ▼	
7	Enable ▼	AutoNegotiation ▼	Disable ▼	
8	Enable ▼	AutoNegotiation ▼	Disable ▼	
9	Enable ▼	AutoNegotiation ▼	Disable ▼	
10	Enable ▼	AutoNegotiation ▼	Disable ▼	

AutoNegotiation  
 10 Full  
 10 Half  
 100 Full  
 100 Half  
 1000 Full

Select the port you want to configure and make changes to the port.

In **State** column, you can enable or disable the state of this port. Once you disable, the port stop to link to the other end and stop to forward any traffic. The default setting is Enable which means all the ports are workable when you receive the device.

In **Speed/Duplex** column, you can configure port speed and duplex mode of this port. Below are the selections you can choose:

Fast Ethernet Port 1~8 (fa1~fa8): AutoNegotiation, 10M Full Duplex (10 Full), 10M Half Duplex (10 Half), 100M Full Duplex (100 Full) and 100M Half Duplex (100 Half).

Gigabit Ethernet Port 9~10: (gi9~gi10): AutoNegotiation, 10M Full Duplex (10 Full), 10M Half Duplex (10 Half), 100M Full Duplex (100 Full), 100M Half Duplex (100 Half), 1000M Full Duplex (1000 Full), 1000M Half Duplex (1000 Half).

The default mode is Auto Negotiation mode.

In **Flow Control** column, “Symmetric” means that you need to activate the flow control function of the remote network device in order to let the flow control of that corresponding port on the switch to work. “Disable” means that you don’t need to activate the flow control function of the remote network device, as the flow control of that corresponding port on the switch will work anyway.

Description: the description of interface. It supports maximum characters length is 130.

Once you finish configuring the settings, click on **Apply** to save the configuration.

**Technical Tips:** *If both ends are not at the same speed, they can’t link with each other. If both ends are not in the same duplex mode, they will be connected by half mode.*

### 4.3.2 Port Status

Port Status shows you current port status.

#### Port Status Help

Port	Link	State	Speed/Duplex	Flow Control	SFP Vendor	Wavelength	Distance
1	Up	Enable	100 Full	Disable	---	---	---
2	Down	Enable	---	Disable	---	---	---
3	Down	Enable	---	Disable	---	---	---
4	Down	Enable	---	Disable	---	---	---
5	Down	Enable	---	Disable	---	---	---
6	Down	Enable	---	Disable	---	---	---
7	Down	Enable	---	Disable	---	---	---
8	Down	Enable	---	Disable	---	---	---
9	Down	Enable	---	Disable	---	---	---
10	Down	Enable	---	Disable	---	---	---

#### SFP DDM

Port	SFP Scan/Eject	SFP DDM	Temperature (degree)		Tx Power (dBm)		Rx Power (dBm)	
			Current	Range	Current	Range	Current	Range
9	Scan	Enable	---	---	---	---	---	---
10	Eject	Enable	---	---	---	---	---	---

The description of the columns is as below:

**SFP Vendor:** Vendor name of the SFP transceiver you plugged.

**Wavelength:** The wave length of the SFP transceiver you plugged.

**Distance:** The distance of the SFP transceiver you plugged.

**Reload:** reload the all port information.

**Scan all:** scan the SFP transceiver and display.

**Eject:** Eject the SFP transceiver that you have selected. You can eject one port or eject all by click the icon “Eject All”.

**Temperature:** The temperature spcific and current detected of DDM SFP transceiver.

**Tx Power (dBm):** The specification and current transmit power of DDM SFP transceiver.

**Rx Power (dBm):** The specification and current received power of DDM SFP transceiver.

**Note:** 1. Most of the SFP transceivers provide vendor information which allows your switch to read it. The UI can display vendor name, wave length and distance of all Korenix SFP transceiver family. If you see Unknown info, it may mean that the vendor doesn't provide their information or that the information of their transceiver can't be read.

2. If the plugged DDM SFP transceiver is not certified by Korenix, the DDM function will not be supported. But the communication still works.

### 4.3.3 Rate Control

**Rate Control** Help

---

Port	Ingress Rule		Egress Rule	
	Packet Type	Rate(Mbps)	Packet Type	Rate(Mbps)
1	Broadcast Only	8	All	0
2	Broadcast Only	8	All	0
3	Broadcast Only	8	All	0
4	Broadcast Only	8	All	0
5	Broadcast Only	8	All	0
6	Broadcast Only	8	All	0
7	Broadcast Only	8	All	0
8	Broadcast Only	8	All	0
9	Broadcast Only	8	All	0
10	Broadcast Only	8	All	0

Apply

- Broadcast Only
- Broadcast/Multicast
- Broadcast/Multicast/Unknown Unicast
- All

---

Rate limiting is a form of flow control used to enforce a strict bandwidth limit at a port. You can program separate transmit (Egress Rule) and receive (Ingress Rule) rate limits at each port, and even apply the limit to certain packet types as

described below.

**Packet type:** You can select the packet type that you want to filter. The packet types of the Ingress Rule listed here include **Broadcast Only / Broadcast and multicast / Broadcast, Multicast and Unknown Unicast** or **All**. The packet types of the Egress Rule (outgoing) only support **all** packet types.

**Rate:** This column allows you to manually assign the limit rate of the port. Valid values are from 1Mbps-100Mbps for fast Ethernet ports and gigabit Ethernet ports. The step of the rate is 1 Mbps. Default value of Ingress Rule is “8” Mbps; default value of Egress Rule is 0 Mbps. 0 stands for disabling the rate control for the port.

Click on **Apply** to apply the configuration.

### 4.3.4 Port Trunking

Port Trunking configuration allows you to group multiple Ethernet ports in parallel to increase link bandwidth. The aggregated ports can be viewed as one physical port so that the bandwidth is higher than merely one single Ethernet port. The member ports of the same trunk group can balance the loading and backup for each other. Port Trunking feature is usually used when you need higher bandwidth for backbone network. This is an inexpensive way for you to transfer more data.

There are some different descriptions for the port trunking. Different manufacturers may use different descriptions for their products, like Link Aggregation Group (LAG), Link Aggregation Control Protocol, Ethernet Trunk, Ether Channel...etc. Most of the implementations now conform to IEEE standard, 802.3ad.

The aggregated ports can interconnect to the other switch which also supports Port Trunking. Korenix Supports 2 types of port trunking. One is Static Trunk, the other is 802.3ad. When the other end uses 802.3ad LACP, you **should** assign 802.3ad LACP to the trunk. When the other end uses non-802.3ad, you can then use Static Trunk.

There are 2 configuration pages, Aggregation Setting and Aggregation Status.

#### Aggregation Setting

**Trunk Size:** The switch can support up to 8 trunk groups with 2 trunk members. Since the member ports should use same speed/duplex, max trunk members for 100Mbps would be 8, and 2 for gigabit.

**Group ID:** Group ID is the ID for the port trunking group. Ports with same group ID are in the same group.

**Type: Static and 802.3ad LACP.** Each Trunk Group can only support Static or 802.3ad LACP. Choose the type you need here.

**Port Trunk - Aggregation Configuration** Help

---

Port	Group ID	Trunk Type
1	1	Static
2	2	LACP
3	0	
4	0	
5	0	
6	0	
7	0	
8	0	
9	0	
10	0	

Apply Reload

---

This page shows the status of port aggregation. Once the aggregation ports are negotiated well, you will see following status.

## Port Trunk - Aggregation Information

Help

Group ID	Type	Aggregated Ports	Individual Ports	Link Down Ports
1	Static	1		
2	LACP			2
3	N/A			
4	N/A			
5	N/A			
6	N/A			
7	N/A			
8	N/A			

Reload

**Group ID:** Display Trunk 1 to Trunk 5 set up in Aggregation Setting.

**Type:** Static or LACP set up in Aggregation Setting.

**Aggregated:** When LACP links well, you can see the member ports in aggregated column.

**Individual:** When LACP is enabled, member ports of LACP group which are not connected to correct LACP member ports will be displayed in the Individual column.

**Link Down:** When LACP is enabled, member ports of LACP group which are not linked up will be displayed in the Link Down column.

## **4.4 Power over Ethernet**

Power over Ethernet is the key features of *JetNet* PoE Switch. It is fully compliance with IEEE 802.3af and IEEE 802.3at that include 1-event with IEEE 802.1AB LLDP classification and 2-event classification mechanisms for PoE MDI. The *JetNet 5310G adapts* 8-Port PoE injectors in port 1 to port 8, each port with the ability to deliver 30W to compatible IEEE 802.3at standard and provides 240 w power budget for hall system. Therefore, select and install the PoE PD system is

The following commands are included in this section:

4.4.1 PoE Control

4.4.2 PoE Scheduling

4.4.3 PoE Status

4.4.4 Command Line for PoE control

4.4.1 PoE Control

The PoE control includes 3 parts- **PoE System**, **Port configuration** and **PD status detection**. The following will introduce the function.

**PoE System Dialogue**

Power	Budget(W)	Voltage(V)	Warning Water Level(%)
DC 1	0	48	0
DC 2	0	48	

**PoE System:** enable or disable system’s PoE function.

**Budget (W):** the power supply maximum output budget. Both power budget of DC 1 and DC2 will be aggregated.

**Voltage (V):** the voltage of applied to the power input. Here, we suggest uses same specification of power supply. If the power supply with different output voltage, it may cause system draw more current from one power model which with higher voltage.

**Warning Water Level (%):** the warning level is for system warning to alerts user when PoE system drawing power that meet the warning level user defined.

**Port Configuration Dialogue**

Port	PoE Mode	Powering Mode	Power Budget(W)	Power Priority
1	Enable	802.3af	32.0	Critical
2	Disable	802.3at(LLDP)	32.0	Critical
3	Disable	802.3at(2-Event)	32.0	Critical
4	Disable	Force	32.0	Critical
5	Disable	802.3af	32.0	Critical
6	Disable	802.3af	32.0	Critical

**PoE Mode:** Enable/Disable port’s PoE function.

**Powering Mode:** 802.3af, 802.3at(LLDP), 802.3at(2-event) and forced mode. Forced mode will ignore the classification behaviors and apply power onto the RJ-45, uses the forced mode must be carefully.

**Power Budget(W):** it allows user assign the budget control in this field.

**Power priority:** it supports 3 levels, Critical, High and low. If the system PoE consumption is over the system budget control, the PoE system will turn off low priority port PoE function, until the consumption is becomes smaller than the system budget.

### PD Status Detection Dialogue

The JetNet PoE Switch supports an useful function that help user to maintain the PD's status and help use to save the maintenance time and money.

**IP address:** the PD's IP address that installed on the port.

**Cycle time:** user measured the PD system boots duration time. The unit is second. Most of PD system – IP camera will take at least 40~50 seconds. Here, we suggest user sets the cycle time to 90 seconds prevents any wrong suppose.

PD Status Detection			Enable
PD	IP Address	Cycle Time(s)	
1	192.168.10.200	60	
2			
3			
4			
5			
6			

Apply

Once user defined this function, the PoE Switch will request PD system and turn-off PoE power if PD system does not echo the request. After the duration time (cycle time), the PoE switch will start request PD again. This function also named **link partner line detection (LPLD)** which is patented by **Korenix**.

**Note: During the PoE operating, the surface will accumulate heat and caused surface temperature becomes higher than ambient temperature. Do remember don't touch device surface during PoE operating.**

**DO NOT TOUCH DEVICE SURFACE DURING PoE PROGRESS HIGH POWER FEEDING**

**Note:** To enable the IEEE 802.3at High Power PoE function, the power input voltage should be DC 52~57V to obtain better performance. Applies DC 48V to PoE Switch and perform 30W high power output may cause the PoE disable automatically, due the output current protect mechanism activated (**0.686A current limit**). To avoid this issue, we suggest adjust the power supply output to 52V DC or higher. In usually, the Switching power supply adopted adjust resistor for voltage fine tune.

4.4.2 PoE Scheduling

The PoE Scheduling control is a powerful function to help you save power and money. You need to configure **PoE Scheduling** and select a target port manually to enable this function.

Power over Ethernet Schedule

PoE Schedule on Port 1 is Enabled

Time	Sunday	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
00:00	Blue						Blue
01:00	Blue						Blue
02:00	Blue						Blue
03:00	Blue						Blue
04:00	Blue						Blue
05:00	Blue						Blue
06:00	Blue	Blue				Blue	Blue
07:00	Blue	Blue				Blue	Blue
08:00	Blue	Blue				Blue	Blue
09:00	Blue	Blue				Blue	Blue
10:00	White	Blue				Blue	White
11:00	White	Blue	Blue		Blue	Blue	White
12:00	White	Blue	Blue		Blue	Blue	White
13:00	White	Blue	Blue		Blue	Blue	White
14:00	White	Blue	Blue		Blue	Blue	White
15:00	White	White			Blue	White	White
16:00	White	White	Blue	Blue	Blue	White	White
17:00	White	White	Blue	Blue	Blue	White	White
18:00	White	White	Blue	Blue	Blue	White	White
19:00	White	White	Blue	Blue	Blue	White	White
20:00	White	White	White	Blue	White	White	White
21:00	White	White	White	Blue	White	White	White
22:00	White	White	White	Blue	White	White	White
23:00	White	White	White	Blue	White	White	White

The Power over Ethernet schedule supports hourly and weekly base PoE schedule configuration.

Select the target port and marking the time frame, then click **Apply** to activate the PoE scheduling function. The PoE port will working as the predefined behavior and follows the system clock. As this result, be sure the system clock have configured as your local time for the reference of scheduling control.

### 4.4.3 PoE Status

The PoE Status page shows the system PoE status and the operating status of each PoE Port. The information includes PoE mode, Operation status, and PD class, Power Consumption, Voltage and Current. For system information, it includes the setting of system power budget, PoE system output power, setting of warning level, utilization of system power and event.

**Power over Ethernet Status**

Power Budget	DC W
Output Power	0.9 W
Warning Water Level	N/A
Utilization	1 %
Event	Normal

Port	PoE Mode	Operation Status	PD Class	Consumption(W)	Voltage(V)	Current(mA)
1	Enable	Searching	N/A	0.0	0.0	0
2	Enable	Powering	Class0	0.8	48.5	17
3	Disable	Off	N/A	0.0	0.0	0
4	Disable	Off	N/A	0.0	0.0	0
5	Enable	Powering	N/A	0.1	48.5	3
6	Disable	Off	N/A	0.0	0.0	0
7	Disable	Off	N/A	0.0	0.0	0
8	Disable	Off	N/A	0.0	0.0	0

### 4.4.4 Command Line for PoE control

<b>Syntax</b>	<b>show poe system</b>
<b>Parameters</b>	--
<b>Command Mode</b>	Enable mode
<b>Description</b>	Display the status of the PoE system.
<b>Examples</b>	<pre>Switch&gt; enable Switch# show poe system PoE System   PoE Admin : Enable   PoE Hardward : Normal   PoE Input Voltage : 47.700 V   Output power : 0.00 Watts   Power Budget :     Budget : 240 Watts     Warning water level : N/A     Utilization : 0 %     Event : Normal</pre>
<b>Syntax</b>	<b>show poe interface IFNAME</b>
<b>Parameters</b>	IFNAME : interface name

<b>Command Mode</b>	Enable mode
<b>Description</b>	Display the PoE status of interface.
<b>Examples</b>	<pre>Switch&gt; enable Switch# show poe interface fa1 Interface fastethernet1 (POE Port 1)   Control Mode : User (Disable)   Powering Mode : 802.3af   Operation Status : Off   Detection Status : Valid   Classification : N/A   Priority : Highest   Output Power : 0.0 Watts, Voltage : 0.0 V, Current : 0 mA   Power Budget :     Budget : 32.0 Watts, effective 0 Watts     Warning water level : N/A     Utilization : 0 %     Event : Normal</pre>
<b>Syntax</b>	<b>show poe pd_detect</b>
<b>Parameters</b>	--
<b>Command Mode</b>	Enable mode
<b>Description</b>	Display the status of pd status detection.
<b>Examples</b>	<pre>Switch# show poe pd-detect PD Status Detection   Status : Enabled   Host 1 :     Target IP : 192.168.10.100     Cycle Time : 10   Host 2 :     Target IP : 192.168.10.200     Cycle Time : 20   Host 3 :     Target IP : 192.168.10.15     Cycle Time : 30   Host 4 :     Target IP : 192.168.10.20     Cycle Time : 40</pre>
<b>Syntax</b>	<b>show poe schedule IFNAME</b>
<b>Parameters</b>	IFNAME : interface name
<b>Command Mode</b>	Enable mode
<b>Description</b>	Display the status of schedule of interface.
<b>Examples</b>	<pre>Switch# show poe schedule fa1 Interface fastethernet1   POE Schedule     Status : Disable     Weekly Schedule :       Sunday : 0,1,2,3,4,5,6,7,8,19,20,21,22,23       Monday : 0,1,2,3,4,5,6,7,8,19,20,21,22,23       Tuesday : 0,1,2,3,4,5,6,7,8,19,20,21,22,23       Wednesday : 0,1,2,3,4,5,6,7,8,19,20,21,22,23       Thursday : 0,1,2,3,4,5,6,7,8,19,20,21,22,23       Friday : 0,1,2,3,4,5,6,7,8,19,20,21,22,23       Saturday :</pre>

	0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20
<b>Syntax</b>	<b>poe powering-mode 802.3af/forced</b>
<b>Parameters</b>	802.3af: deliver power if and only if the attached PD comply with IEEE 802.3af forced: deliver power no matter what PD attached
<b>Command Mode</b>	Interface mode
<b>Description</b>	Set the Powering mode of PoE
<b>Examples</b>	EX 1: <i>Set 802.3af powering mode</i> Switch(config)# poe powering-mode 802.3af EX 2: <i>Set forced powering mode</i> Switch(config)# poe powering-mode forced
<b>Syntax</b>	<b>poe powering-mode 802.3at 2-event/lldp</b>
<b>Parameters</b>	2-event: deliver power if and only if the attached PD comply with IEEE 802.3at physical layer classification lldp: deliver power if and only if the attached PD comply with IEEE 802.3at data link layer classification
<b>Command Mode</b>	Interface mode
<b>Description</b>	Set the Powering mode of PoE
<b>Examples</b>	EX 1: <i>Set 802.3at 2-event powering mode</i> Switch(config)# poe powering-mode 802.3at 2-event EX 2: <i>Set 802.3at lldpforced powering mode</i> Switch(config)# poe powering-mode 802.3at lldp
<b>Syntax</b>	<b>poe control-mode user/schedule</b>
<b>Parameters</b>	user: user mode schedule: schedule mode
<b>Command Mode</b>	Interface mode
<b>Description</b>	Set the control mode of port
<b>Examples</b>	Set PoE port 2 to user mode. EX 1: Switch(config)# interface fa2 Switch(config-if)# poe control-mode user Set PoE port 2 to schedule mode. EX 2: Switch(config-if)# poe control-mode schedule
<b>Syntax</b>	<b>poe user enable/disable</b>
<b>Parameters</b>	enable: enable port in user mode disable: disable port in user mode
<b>Command Mode</b>	Interface mode
<b>Description</b>	Enable/Disable the PoE of the port in user mode. If in schedule mode, it will come into effect when the control mode changes to user mode.
<b>Examples</b>	To enable the PoE function in user mode Switch(config-if)# poe user enable To disable the PoE function in user mode Switch(config-if)# poe user disable
<b>Syntax</b>	<b>poe type</b>
<b>Parameters</b>	TYPE : port type string with max 20 characters
<b>Command Mode</b>	Interface mode

<b>Description</b>	Set the port type string.
<b>Examples</b>	Set the type string to "IPCam-1. Switch(config-if)# poe type IPCam-1
<b>Syntax</b>	<b>poe budget [POWER]</b>
<b>Parameters</b>	POWER : 0.4 – 30
<b>Command Mode</b>	Interface mode
<b>Description</b>	Set the port budget. The max budget is different between 802.3af, 802.3at and forced powering mode. The max budget of 802.3af powering mode is 15.4. The max budget of 802.3at powering mode is 30 The max budget of force powering mode is 30.
<b>Examples</b>	Set the max value of power consumption to 12 W with manual mode. Switch(config-if)# poe budget 12
<b>Syntax</b>	<b>poe budget warning &lt;0-100&gt;</b>
<b>Parameters</b>	<0-100> 0 is disable, valid range is 1 to 100 percentage
<b>Command Mode</b>	Interface mode
<b>Description</b>	Set the warning water level of port budget.
<b>Examples</b>	Set the warning water level to 60% Switch(config-if)# poe budget warning 60
<b>Syntax</b>	<b>poe priority critical/high/low</b>
<b>Parameters</b>	Critical : Highest priority level High : High priority level Low : Low priority level
<b>Command Mode</b>	Interface mode
<b>Description</b>	Set the powering priority. The port with higher priority will have the privilege to delivery power under limited power situation.
<b>Examples</b>	Set the priority to critical Switch(config-if)# poe priority critical
<b>Syntax</b>	<b>poe schedule weekday hour</b>
<b>Parameters</b>	Weekday : Valid range 0-6 (0=Sunday, 1=Monday, ..., 6=Saturday) Hour : Valid range 0-23, Valid format a,b,c-d
<b>Command Mode</b>	Interface mode
<b>Description</b>	Add a day schedule to an interface.
<b>Examples</b>	Add a schedule which enables PoE function at hour 1, 3, 5 and 10 to 23 on Sunday. Switch(config-if)# poe schedule 0 1,3,5,10-23
<b>Syntax</b>	<b>no poe schedule weekday</b>
<b>Parameters</b>	Weekday : Valid range 0-6 (0=Sunday, 1=Monday, ..., 6=Saturday)
<b>Command Mode</b>	Interface mode
<b>Description</b>	Remove a day schedule
<b>Examples</b>	Remove the Sunday schedule. Switch(config-if)# no poe schedule 0
<b>Syntax</b>	<b>PoE budget DC1/DC2 [POWER]; system command for JetNet 5310G is 240 Watts under 60 degree C operating temperature.</b>
<b>Parameters</b>	POWER : 0~200

<b>Command Mode</b>	Configuration mode
<b>Description</b>	Set the power budget of DC1
<b>Examples</b>	Set the power budget of DC1 to 200W Switch(config)# poe budget DC1 200w
<b>Syntax</b>	<b>poe budget warning &lt;0-100&gt;</b>
<b>Parameters</b>	<0-100> 0 is disable, valid range is 1 to 100 percentage
<b>Command Mode</b>	Configuration mode
<b>Description</b>	Set the warning water level of total power budget.
<b>Examples</b>	Set the warning water level to 60% Switch(config-if)# poe budget warning 60
<b>Syntax</b>	<b>poe pd_detect enable/disable</b>
<b>Parameters</b>	enable: enable PD Status Detection function disable: disable PD Status Detection function
<b>Command Mode</b>	Configuration mode
<b>Description</b>	Enable/Disable the PD Status Detection function
<b>Examples</b>	To enable the function of pd status detect function Switch(config)# poe pd_detect enable To disable the function of pd status detect function Switch(config)# poe pd_detect disable
<b>Syntax</b>	<b>poe pd_detect ip_address cycle_time</b>
<b>Parameters</b>	IP address : A.B.C.D Cycle time : Valid range 10-3600 second and must be multiple of 10
<b>Command Mode</b>	Configuration mode
<b>Description</b>	Apply a rule of PD Status Detection.
<b>Examples</b>	Apply a rule which ping 192.160.1.2 per 20 seconds. And if 192.160.1.2 is timeout, pd status detection will re-enable the PoE. Switch(config)# poe pd_detect 192.160.1.2 20

## 4.5 Network Redundancy

It is critical for industrial applications that network remains non-stop. JetNet Switch supports standard RSTP, Multiple Super Ring, Rapid Dual Homing and backward compatible with Legacy Super Ring Client modes.

Multiple Super Ring (MSR) technology is *Korenix's* 3<sup>rd</sup> generation Ring redundancy technology. This is patented and protected by *Korenix* and is used in countries all over the world. MSR ranks the fastest restore and failover time in the world, 0 ms for restore and about 5 milliseconds for failover for copper.

Advanced Rapid Dual Homing (RDH) technology also facilitates JetNet Switch to connect with a core managed switch easily and conveniently. With RDH technology, you can also couple several Rapid Super Rings or RSTP cloud together, which is also known as Auto Ring Coupling.

To become backwards compatible with the Legacy Super Ring technology implemented in *JetNet 4000/4500* switches, JetNet Switch also supports Super Ring Client mode. The Super Ring ports can pass through Super Ring control packets extremely well and works with Super Ring.

Besides Korenix ring technology, *all JetNet Managed Switch* support 802.1D-2004 version Rapid Spanning Tree Protocol (RSTP). New version of RSTP standard includes 802.1D-1998 STP, 802.1w RSTP, IEEE 802.1s MSTP (Multiple Spanning Tree). The MSTP function is available from 1.1 version firmware, if your device does not support it, please download the new firmware from Korenix Web site. Following commands are included in this group:

4.5.1 STP configuration

4.5.2 STP Port configuration

4.5.3 STP information

4.5.4 MSTP configuration

4.5.5 MSTP Port Configuration

4.5.6 MSTP information

4.5.7 Multiple Super Ring

4.5.8 Multiple Super Ring Info

4.5.9 Loop Protection

4.5.10 Command Lines for Network Redundancy

### 4.5.1 STP Configuration

This page allows select the STP mode and configuring the global STP/RSTP Bridge Configuration.

The STP mode includes the **STP**, **RSTP**, **MSTP** and **Disable**. Please select the STP mode for your system first. The default mode is RSTP enabled.

After selecting the STP or RSTP mode, to configure the global Bridge parameters for STP and RSTP.

After selecting the MSTP mode, please go to MSTP Configuration page.

The screenshot shows a web-based configuration page titled "STP Configuration". At the top, there is a label "STP Mode" next to a dropdown menu. The dropdown menu is open, showing the following options: "Disable", "STP", "RSTP", "MSTP", and "Disable". Below the dropdown, there are several configuration fields, each with a label and a value or dropdown arrow:

- Bridge Address:** 1212
- Bridge Priority:** (dropdown arrow)
- Max Age:** 20
- Hello Time:** 2
- Forward Delay:** 15

At the bottom of the form, there is a button labeled "Apply".

#### **RSTP (Refer to the 4.4.1 of previous version manual.)**

RSTP is the abbreviation of Rapid Spanning Tree Protocol. If a switch has more than one path to a destination, it will lead to message loops that can generate broadcast storms and quickly bog down a network. The spanning tree was created to combat the negative effects of message loops in switched networks. A spanning tree uses a spanning tree algorithm (STA) to automatically sense whether a switch has more than one way to communicate with a node. It will then select the best path (primary), and block the other path(s). It will also keep track of the blocked path(s) in case the primary path fails. Spanning Tree Protocol (STP) introduced a standard method to accomplish this. It is specified in IEEE 802.1D-1998. Later, Rapid Spanning Tree Protocol (RSTP) was adopted and represents the evolution of STP, providing much faster spanning tree convergence after a topology change. This is specified in IEEE 802.1w. In 2004, 802.1w is included into 802.1D-2004 version. This switch supports both RSTP and STP (all switches that support RSTP are also backward compatible with switches that support only STP).

## Bridge Configuration

**Bridge Address:** This shows the switch's MAC address.

**Priority (0-61440):** RSTP uses bridge ID to determine the root bridge, the bridge with the highest bridge ID becomes the root bridge. The bridge ID is composed of bridge priority and bridge MAC address. So that the bridge with the highest priority becomes the highest bridge ID. If all the bridge ID has the same priority, the bridge with the lowest MAC address will then become the root bridge.

Note: The bridge priority value must be in multiples of 4096. A device with a lower number has a higher bridge priority. Ex: 4096 is higher than 32768.

Note: The Web GUI allows user select the priority number directly. This is the convenience of the GUI design. When you configure the value through the CLI or SNMP, you may need to type the value directly. Please follow the  $n \times 4096$  rules for the Bridge Priority.

**Max Age (6-40):** Enter a value from 6 to 40 seconds here. This value represents the time that a bridge will wait without receiving Spanning Tree Protocol configuration messages before attempting to reconfigure.

If JetNet is not the root bridge, and if it has not received a hello message from the root bridge in an amount of time equal to Max Age, then JetNet will reconfigure itself as a root bridge. Once two or more devices on the network are recognized as a root bridge, the devices will renegotiate to set up a new spanning tree topology.

**Hello Time (1-10):** Enter a value from 1 to 10 seconds here. This is a periodic timer that drives the switch to send out BPDUs (Bridge Protocol Data Unit) packets to check current STP status.

The root bridge of the spanning tree topology periodically sends out a "hello" message to other devices on the network to check if the topology is "healthy". The "hello time" is the amount of time the root has waited during sending hello messages.

**Forward Delay Time (4-30):** Enter a value between 4 and 30 seconds. This value is the time that a port waits before changing from Spanning Tree Protocol learning and listening states to forwarding state.

This is the amount of time JetNet will wait before checking to see if it should be changed to a different state.

Once you have completed your configuration, click on **Apply** to apply your settings.

**Note:** You must observe the following rule to configure Hello Time, Forwarding Delay, and Max Age parameters.

**$2 \times (\text{Forward Delay Time} - 1 \text{ sec}) \geq \text{Max Age Time} \geq 2 \times (\text{Hello Time value} + 1 \text{ sec})$**

4.5.2 STP Port Configuration

This page allows you to configure the port parameter after enabled STP or RSTP.

**Port Configuration**

Select the port you want to configure and you will be able to view current setting and status of the port.

**STP Port Configuration**

Port	Path Cost	Priority	Link Type	Edge Port
1	20000	128	Auto	Enable
2	20000	128	Auto	Enable
3	20000	128	Auto	Enable
4	20000	128	Auto	Enable
5	20000	128	Auto	Enable
6	20000	128	Auto	Enable
7	20000	128	Auto	Enable
8	20000	128	Auto	Enable
9	20000	128	Auto	Enable

Apply

**Path Cost:** Enter a number between 1 and 200,000,000. This value represents the “cost” of the path to the other bridge from the transmitting bridge at the specified port.

**Priority:** Enter a value between 0 and 240, using multiples of 16. This is the value that decides which port should be blocked by priority in a LAN.

**Link Type:** There are 3 types for you select. **Auto**, **P2P** and **Share**.

Some of the rapid state transitions that are possible within RSTP depend upon whether the port of concern can only be connected to another bridge (i.e. it is served by a point-to-point LAN segment), or if it can be connected to two or more bridges (i.e. it is served by a shared-medium LAN segment). This function allows link status of the link to be manipulated administratively. “**Auto**” means to auto select P2P or Share mode. “**P2P**” means P2P is enabled; the 2 ends work at Full-duplex mode. While “**Share**” is enabled, it means P2P is disabled, the 2 ends may connect through a share media and work in Half duplex mode.

**Edge:** A port directly connected to the end stations cannot create a bridging loop in the network. To configure this port as an edge port, set the port to the **Enable** state. When the non-bridge device connects an admin edge port, this port will be in blocking state and turn to forwarding state in 4 seconds.

Once you finish your configuration, click on **Apply** to save your settings.

### 4.5.3 RSTP Info

This page allows you to see the information of the root switch and port status.

**RSTP Information**

**Root Information**

Bridge ID	8000.0012.7760.1455
Root Priority	32768
Root Port	N/A
Root Path Cost	0
Max Age(6-40)	20 sec
Hello Time(1-10)	2 sec
Forward Delay(4-30)	15 sec

**Port Information**

Port	Role	Port State	Path Cost	Port Priority	Oper P2P	Oper Edge
1	--	Disabled	200000	128	P2P	Edge
2	--	Disabled	200000	128	Shared	Edge
3	Designated	Forwarding	200000	128	P2P	Non-Edge
4	--	Disabled	200000	128	Shared	Edge
5	--	Disabled	200000	128	Shared	Edge
6	--	Disabled	200000	128	Shared	Edge
7	--	Disabled	200000	128	Shared	Edge
8	--	Disabled	200000	128	P2P	Edge
9	Designated	Forwarding	200000	128	P2P	Edge
10	Designated	Forwarding	20000	128	P2P	Edge

**Root Information:** You can see root Bridge ID, Root Priority, Root Port, Root Path Cost and the Max Age, Hello Time and Forward Delay of BPDU sent from the root switch.

**Port Information:** You can see port Role, Port State, Path Cost, Port Priority, Open P2P mode, Open edge port mode and Aggregated (ID/Type).

### 4.5.4 MSTP (Multiple Spanning Tree Protocol) Configuration

MSTP is the abbreviation of Multiple Spanning Tree Protocol. This protocol is a direct extension of RSTP. It can provide an independent spanning tree for different VLANs. It simplifies network management, provides for even faster convergence than RSTP by limiting the size of each region, and prevents VLAN members from being segmented from the rest of the group (as sometimes occurs with IEEE 802.1D STP).

While using MSTP, there are some new concepts of network architecture. A switch may belong to different group, acts as root or designate switch, generate BPDU for the network to maintain the forwarding table of the spanning tree. With MSTP, it can also provide multiple forwarding paths and enable load

balancing. Understand the architecture allows you to maintain the correct spanning tree and operate effectively.

One VLAN can be mapped to a Multiple Spanning Tree Instance (MSTI). The maximum Instance of JetNet Managed Switch support is 16, range from 0-15. The MSTP builds a separate Multiple Spanning Tree (MST) for each instance to maintain connectivity among each of the assigned VLAN groups. An Internal Spanning Tree (IST) is used to connect all the MSTP switches within an MST region. An MST Region may contain multiple MSTP Instances.

The figure shows there are 2 VLANs/MSTP Instances and each instance has its Root and forwarding paths.

A Common Spanning Tree (CST) interconnects all adjacent MST regions and acts as a virtual bridge node for communications with STP or RSTP nodes in the global network. MSTP connects all bridges and LAN segments with a single Common and Internal Spanning Tree (CIST). The CIST is formed as a result of the running spanning tree algorithm between switches that support the STP, RSTP, MSTP protocols.

The figure shows the CST large network. In this network, a Region may have

different instances and its own forwarding path and table; however, it acts as a single Bridge of CST.

To configure the MSTP setting, the STP Mode of the STP Configuration page should be changed to MSTP mode first.

## STP Configuration

STP Mode  ▼

### Bridge Configuration

Bridge Address	0012.7760.46b6
Bridge Priority	32768 ▼
Max Age	20 ▼
Hello Time	2 ▼
Forward Delay	15 ▼

After enabled MSTP mode, then you can go to the MSTP configuration pages.

### MSTP Region Configuration

This page allows configure the Region Name and its Revision, mapping the VLAN to Instance and check current MST Instance configuration. The network can be divided virtually to different Regions. The switches within the Region should have the same Region and Revision level.

**Region Name:** The name for the Region. Maximum length: 32 characters.

**Revision:** The revision for the Region. Range: 0-65535; Default: 0)

Once you finish your configuration, click on **Apply** to apply your settings.

### New MST Instance

This page allows mapping the VLAN to Instance and assign priority to the instance. Before mapping VLAN to Instance, you should create VLAN and assign the member ports first. Please refer to the VLAN setting page.

### MSTP Configuration

#### MST Region Configuration

Region Name	Korenix
Revision	0

Apply

#### New MST Instance

Instance ID	1
VLAN Group	
Instance Priority	32768

Add

**Instance ID:** Select the Instance ID, the available number is 1-15.

**VLAN Group:** Type the VLAN ID you want mapping to the instance.

**Instance Priority:** Assign the priority to the instance.

**After** finish your configuration, click on **Add** to apply your settings.

#### Current MST Instance Configuration

This page allows you to see the current MST Instance Configuration you added. Click on “**Apply**” to apply the setting. You can “**Remove**” the instance or “**Reload**” the configuration display in this page.

#### Current MST Instance Configuration

Instance ID	VLAN Group	Instance Priority
1	2	32768
2	3	32768

#### 4.5.5 MSTP Port Configuration

This page allows configure the Port settings. Choose the Instance ID you want to configure. The MSTP enabled and linked up ports within the instance will be listed in this table.

Note that the ports not belonged to the Instance, or the ports not MSTP activated will not display. The meaning of the Path Cost, Priority, Link Type and Edge Port is the same as the definition of RSTP.

## MSTP Port Configuration

Instance ID  ▼

Port	Path Cost	Priority	Link Type	Edge Port
1	200000	128	Auto	Enable
2	200000	128	Auto	Enable

**Path Cost:** Enter a number between 1 and 200,000,000. This value represents the “cost” of the path to the other bridge from the transmitting bridge at the specified port.

**Priority:** Enter a value between 0 and 240, using multiples of 16. This is the value that decides which port should be blocked by priority in a LAN.

**Link Type:** There are 3 types for you select. **Auto**, **P2P** and **Share**.

Some of the rapid state transitions that are possible within RSTP depend upon whether the port of concern can only be connected to another bridge (i.e. it is served by a point-to-point LAN segment), or if it can be connected to two or more bridges (i.e. it is served by a shared-medium LAN segment). This function allows link status of the link to be manipulated administratively. “**Auto**” means to auto select P2P or Share mode. “**P2P**” means P2P is enabled; the 2 ends work in full duplex mode. While “**Share**” is enabled, it means P2P is disabled; the 2 ends may connect through a share media and work in half duplex mode.

**Edge:** A port directly connected to the end stations cannot create a bridging loop in the network. To configure this port as an edge port, set the port to the **Enable** state. When the non-bridge device connects an admin edge port, this port will be in blocking state and turn to forwarding state in 4 seconds.

Once you finish your configuration, click on **Apply** to save your settings.

### 4.5.6 MSTP Information

This page allows you to see the current MSTP information.

Choose the **Instance ID** first. If the instance is not added, the information remains blank.

The **Root Information** shows the setting of the Root switch.

The **Port Information** shows the port setting and status of the ports within the instance.

### MSTP Information

Instance ID

#### Root Information

Root Address	0012.7760.ad4b
Root Priority	4096
Root Port	N/A
Root Path Cost	0
Max Age	20 second(s)
Hello Time	2 second(s)
Forward Delay	15 second(s)

#### Port Information

Port	Role	Port State	Path Cost	Port Priority	Link Type	Edge Port
5	Designated	Forwarding	200000	128	P2P Internal(MSTP)	Non-Edge
6	Designated	Forwarding	200000	128	P2P Internal(MSTP)	Non-Edge

Click “**Reload**” to reload the MSTP information display.

**4.5.7 Multiple Super Ring (MSR)**

The most common industrial network redundancy is to form a ring or loop. Typically, the managed switches are connected in series and the last switch is connected back to the first one. In such connection, you can implement Korenix Multiple Super Ring technology to get the fastest recovery performance.

**Multiple Super Ring (MSR)** technology is *Korenix's* 3<sup>rd</sup> generation Ring redundancy technology. This is patented and protected by *Korenix* and is used in countries all over the world. MSR ranks the fastest restore and failover time in the world, 0 ms for restore and about milliseconds level for failover for 100Base-TX copper port. The other interface may take longer time due to the media characteristics.

Advanced **Rapid Dual Homing (RDH)** technology also facilitates *JetNet Managed Switch* to connect with a core managed switch easily and conveniently. With RDH technology, you can also couple several Rapid Super Rings or RSTP cloud together, which is also known as Auto Ring Coupling.

**TrunkRing** technology allows integrate MSR with LACP/Port Trunking. The LACP/Trunk aggregated ports is a virtual interface and it can work as the Ring port of the MSR.

**MultiRing** is an outstanding technology Korenix can support. Multiple rings can be aggregated within one switch by using different Ring ID. The maximum Ring number one switch can support is half of total port volume. For example, the JetNet 5310G is a 10 port Ethernet Switch design, which means maximum 5 Rings (4 100Mbps + 1 Gigabit Rings) can be aggregated in one. The feature saves much effort when constructing complex network architecture.

To become backwards compatible with the Legacy Super Ring technology implemented in *JetNet Managed – JetNet 5310G* switch, *JetNet 4510/4518/5000/6700/6800 Series* also supports Super Ring Client mode. The Super Ring ports can pass through Super Ring control packets extremely well and works with Super Ring.

**New Ring:** To create a Rapid Super Ring. Just fill in the Ring ID which has range from 0 to 31. If the name field is left blank, the name of this ring will be automatically naming with Ring ID.

**New Ring**

Ring ID	Name
1	

Add

Ring Configuration

ID	Name	Version	Device Priority	Ring Port1	Path Cost	Ring Port2	Path Cost	Dual Homing II	Ring Status
1	Ring1	Rapid Super R	128	Port 1	128	Port 2	128	Disable	Enable

Apply Remove Reload

**Ring Configuration**

**ID:** Once a Ring is created, this appears and cannot be changed.

**Name:** This field will show the name of the Ring. If it is not filled in when creating, it will be automatically named by the rule “RingID”.

**Version:** The version of Ring can be changed here. There are three modes to choose: Rapid Super Ring as default; Super ring for compatible with Korenix 1<sup>st</sup> general ring and Any Ring for compatible with other version of rings.

**Device Priority:** The switch with highest priority (highest value) will be automatically selected as Ring Master. Then one of the ring ports in this switch will become forwarding port and the other one will become blocking port. If all of the switches have the same priority, the switch with the biggest MAC address will be selected as Ring Master.

**Ring Port1:** In Rapid Super Ring environment, you should have 2 Ring Ports. No matter this switch is Ring Master or not, when configuring RSR, 2 ports should be selected to be Ring Ports. For Ring Master, one of the ring ports will become the forwarding port and the other one will become the blocking port.

**Path Cost:** Change the Path Cost of Ring Port1. If this switch is the Ring Master of a Ring, then it determines the blocking port. The Port with higher Path Cost in the two ring ports will become the blocking port, if the Path Cost is the same, the port with larger port number will become the blocking port.

**Ring Port2:** Assign another port for ring connection

**Path Cost:** Change the Path Cost of Ring Port2

**Rapid Dual Homing:** Rapid Dual Homing is an important feature of Korenix 3<sup>rd</sup> generation Ring redundancy technology. When you want to connect multiple RSR or form redundant topology with other vendors, RDH could allow you to have maximum 7 multiple links for redundancy without any problem.

In Dual Homing I released with JetNet 4000/4500 series, you have to configure additional port as Dual Homing port to two uplink switches. In Rapid Dual Homing, you don't need to configure specific port to connect to other protocol. The Rapid

Dual Homing will smartly choose the fastest link for primary link and block all the other link to avoid loop. If the primary link failed, Rapid Dual Homing will automatically forward the secondary link for network redundant. Of course, if there are more connections, they will be standby links and recover one of them if both primary and secondary links are broken.

**Ring status:** To enable/disable the Ring. Please remember to enable the ring after you add it.

**MultiRing:** The MultiRing technology is one of the patterns of the MSR technology; it allows you to aggregate multiple rings within one switch. Create multiple ring ID and assign different ring port 1 and port 2 to each ring, thus the switch can have multiple rings in one JetNet Switch.

When implementing MultiRing, remember that the different rings can NOT use the same ring ID. The other settings are the same as above description. Technically, the maximum ring volume the MultiRing supported is up to 16 rings. Due the limited number of ports, the number of ring network is the half of port number.

**TrunkRing:** The MultiRing technology is part of the MSR technology which combines the MSR with the port trunking technology. After multiple ports aggregated, this is so-call port trunking (Static or learnt by LACP protocol), the Trunk ID can be one of the port ID of the MSR technology. Configured the port trunking first then you can add the Trunk group as a Ring Port in managed switch.

### 4.5.8 Ring Info

This page shows the RSR information.

Multiple Super Ring Information							
ID	Version	Role	Status	RM MAC	Blocking Port	Role Transition Count	Ring State Transition Count
1	Rapid Super Ring	nonRM	Normal	0012.7760.b15b	Port2	13	29

Reload

**ID:** Ring ID.

**Version:** which version of this ring, this field could be Rapid Super Ring, Super Ring, or Any Ring

**Role:** This Switch is RM or nonRM

**Status:** If this field is Normal which means the redundancy is approved. If any one of the link in this Ring is broken, then the status will be Abnormal.

**RM MAC:** The MAC address of Ring Master of this Ring. It helps to find the redundant path.

**Blocking Port:** This field shows which is blocked port of RM.

**Role Transition Count:** This means how many times this switch has changed its Role from nonRM to RM or from RM to nonRM.

**Role state Transition Count:** This number means how many times the Ring status has been transformed between Normal and Abnormal state.

#### 4.5.9 Loop Protection

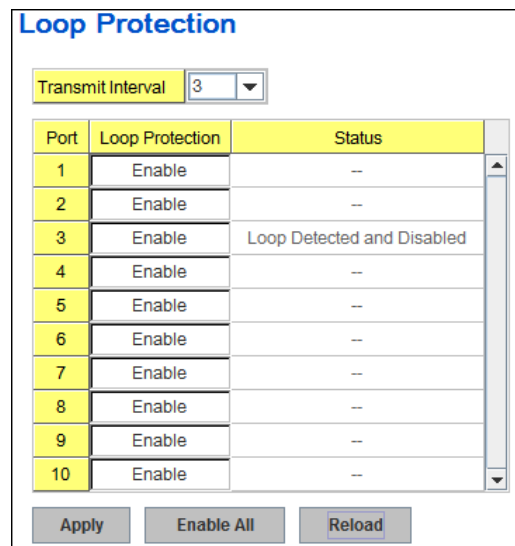

Since firmware version 1.2b, the JetNet 5010G supports loop eliminate function that based on per port or system configure. It prevents any communicate looping caused by RSTP and MSR ring when ring topology change. The following figure shows the WEB UI of Loop Protection.

**Transmit interval:** setting the detect duration time between each detect packet.

**Loop Protection:** Enable/ Disable Loop Protection function by per port, and also offer all interface enable function by click the “**Enable All**” button to enable all interfaces.

**Status:** shows the port status. If there is looping occurred, it will show “Loop Detected and Disabled” information and the link indicator will not turn-off, and also the port is disabled by system. Once the looping is fixed, the blocked port will keep at blocked state, and must be enabled by manual or perform system reset to recovery it.

**Reload:** refresh and update the port status information.

**4.5.10 Command Lines:**

## 4.6 VLAN

A Virtual LAN (VLAN) is a “logical” grouping of nodes for the purpose of limiting a broadcast domain to specific members of a group without physically grouping the members together. That means, VLAN allows you to isolate network traffic so that only members of VLAN could receive traffic from the same VLAN members. Basically, creating a VLAN from a switch is the logical equivalent of physically reconnecting a group of network devices to another Layer 2 switch, without actually disconnecting these devices from their original switches.

JetNet Industrial Ethernet Switch supports 802.1Q VLAN. 802.1Q VLAN is also known as Tag-Based VLAN. This Tag-Based VLAN allows VLAN to be created across different switches (see Figure 1). IEEE 802.1Q tag-based VLAN makes use of VLAN control information stored in a VLAN header attached to IEEE 802.3 packet frames. This tag contains a VLAN Identifier (VID) that indicates which VLAN a frame belongs to. Since each switch only has to check a frame’s tag, without the need to dissect the contents of the frame, this also saves a lot of computing resources within the switch.

Figure 4.6-1 802.1Q VLAN

VLAN Configuration group enables you to Add/Remove VLAN, configure port Ingress/Egress parameters and view VLAN table.

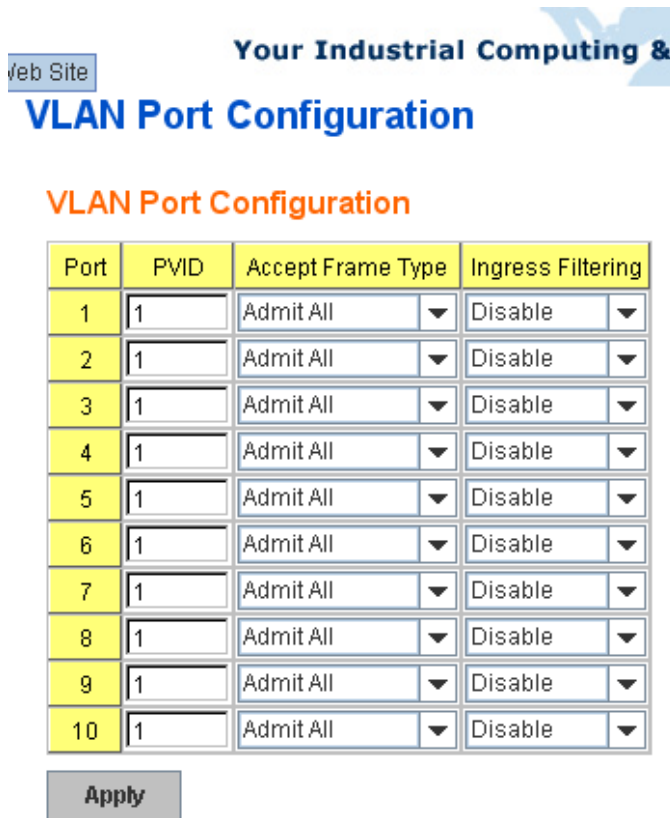

Following commands are included in this group:

- 4.6.1 VLAN Port Configuration
- 4.6.2 VLAN Configuration
- 4.6.3 GVRP Configuration
- 4.6.4 VLAN Table
- 4.6.5 CLI Commands of the VLAN

4.6.1 VLAN Port Configuration

VLAN Port Configuration allows you to set up VLAN port parameters to specific port. These parameters include PVID, Accept Frame Type and Ingress Filtering.

Figure 4.6.1-1 Web UI of VLAN configuration.

**PVID:** The abbreviation of the **Port VLAN ID**. Enter port VLAN ID here. PVID allows the switches to identify which port belongs to which VLAN. To keep things simple, it is recommended that PVID is equivalent to VLAN IDs.

The values of PVIDs are from 0 to 4095. But, 0 and 4095 are reserved. You can't input these 2 PVIDs. 1 is the default value. 2 to 4094 are valid and available in this column. Type the PVID you'd like to configure here.

**Accept Frame Type:** This column defines the accepted frame type of the port. There are 2 modes you can select, **Admit All** and **Tag Only**. Admit all mode means that the port can accept both tagged and untagged packets. Tag only mode means that the port can only accept tagged packets.

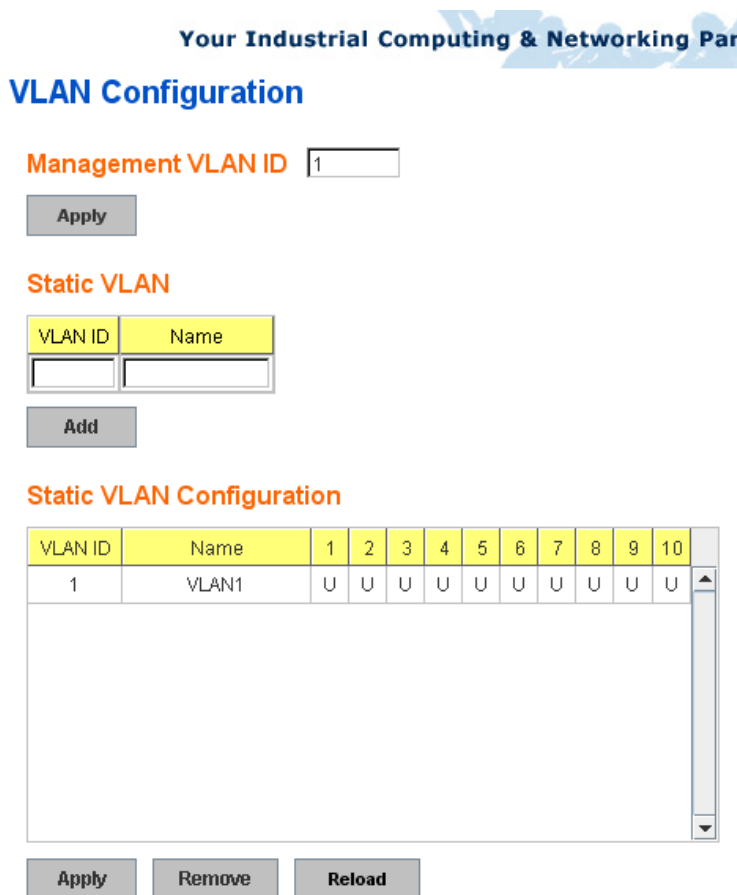

**Ingress Filtering:** Ingress filtering helps VLAN engine to filter out undesired traffic on a port. When Ingress Filtering is enabled, the port checks whether the incoming frames belong to the VLAN they claimed or not. Then the port determines if the frames can be processed or not. For example, if a tagged frame from Engineer VLAN is received, and Ingress Filtering is enabled, the switch will

determine if the port is on the Engineer VLAN’s Egress list. If it is, the frame can be processed. If it’s not, the frame would be dropped.

**4.6.2 VLAN Configuration**

In this page, you can assign Management VLAN, create the static VLAN, and assign the Egress rule for the member ports of the VLAN.

Figure 4.6.2.1 Web UI of the VLAN Configuration.

**Management VLAN ID:** The switch supports management VLAN. The management VLAN ID is the VLAN ID of the CPU interface so that only member ports of the management VLAN can ping and access the switch. The default management VLAN ID is **1**.

**Static VLAN:** You can assign a VLAN ID and VLAN Name for new VLAN here.

**VLAN ID** is used by the switch to identify different VLANs. Valid VLAN ID is between 1 and 4094. 1 is the default VLAN.

**VLAN Name** is a reference for network administrator to identify different VLANs. The available character is 12 for you to input. If you don’t input VLAN name, the system will automatically assign VLAN name for the VLAN. The rule is VLAN (VLAN ID).

**Static VLAN**

Figure 4.6.2-2 the steps to create a new VLAN: Type in VLAN ID and NAME, and press **Add** to create a

new VLAN. Then you can see the new VLAN in the Static VLAN Configuration table. Refer to Figure 4.6.2-3

After created the VLAN, the status of the VLAN will remain in Unused until you add ports to the VLAN.

**Note:** Before you change the management VLAN ID by Web and Telnet, remember that the port attached by the administrator should be the member port of the management VLAN; otherwise the administrator can't access the switch via the network.

**Note:** Currently JetNet6710G only support max 256 groups VLAN.

### Static VLAN Configuration

You can see the created VLANs and specify the egress (outgoing) port rule to be **Untagged or Tagged** here.

Figure 4.6.2-3 Static VLAN Configuration table. You can see that new VLAN 3 is created. VLAN name is test. Egress rules of the ports are not configured now.

#### Static VLAN Configuration

VLAN ID	NAME	1	2	3	4	5	6	7	8	9	10
1	VLAN1	U	U	U	U	U	U	U	U	U	U
2	VLAN2	--	--	--	--	--	--	--	--	--	--
3	test	--	--	--	--	--	--	--	--	--	--

Apply Remove Reload

Figure 4.6.2-4 Configure Egress rule of the ports.

#### Static VLAN Configuration

VLAN ID	NAME	1	2	3	4	5	6	7	8	9	10
1	VLAN1	U	U	U	U	U	U	U	U	U	U
2	VLAN2	U	U	U	U	--	--	--	--	--	--
3	test	--	--	--	--	U	T	T	T	T	T

Apply Remove Reload

--: Not available

**U: Untag:** Indicates that egress/outgoing frames are not VLAN tagged.

**T : Tag:** Indicates that egress/outgoing frames are to be VLAN tagged.

Steps to configure Egress rules: Select the VLAN ID. Entry of the selected VLAN turns to light blue. Assign Egress rule of the ports to **U** or **T**. Press **Apply** to apply the setting. If you want to remove one VLAN, select the VLAN entry. Then press **Remove** button.

### 4.6.3 GVRP configuration

GVRP allows users to set-up VLANs automatically rather than manual configuration on every port of every switch in the network.

Your Industrial Computing & Networking Partner

## GVRP Configuration

GVRP Protocol  ▾

Port	State	Join Timer	Leave Timer	Leave All Timer
1	Disable ▾	20	60	1000
2	Disable ▾	20	60	1000
3	Disable ▾	20	60	1000
4	Disable ▾	20	60	1000
5	Disable ▾	20	60	1000
6	Disable ▾	20	60	1000
7	Disable ▾	20	60	1000
8	Disable ▾	20	60	1000
9	Disable ▾	20	60	1000
10	Disable ▾	20	60	1000

Note: Timer unit is centiseconds.

**GVRP Protocol:** Allow user to enable/disable GVRP globally.

**State:** After enable GVRP globally, here still can enable/disable GVRP by port.

**Join Timer:** Controls the interval of sending the GVRP Join BPDU. An instance of this timer is required on a per-Port, per-GARP Participant basis

**Leave Timer:** Control the time to release the GVRP reservation after received the GVRP Leave BPDU. An instance of the timer is required for each state machine that is in the LV state

**Leave All Timer:** Controls the period to initiate the garbage collection of registered VLAN. The timer is required on a per-Port, per-GARP Participant basis

4.6.4 VLAN Table

This table shows you current settings of your VLAN table, including VLAN ID, Name, Status, and Egress rule of the ports.

Your Industrial Computing & Networking Partner

VLAN Table

VLAN Table

VLAN ID	Name	Status	1	2	3	4	5	6	7	8	9	10
1	VLAN1	Static	U	U	U	U	U	U	U	U	U	U
2	VLAN2	Unused	--	--	--	--	--	--	--	--	--	--
3	test	Static	--	--	U	U	--	T	T	T	--	--

Reload

**VLAN ID:** ID of the VLAN.

**Name:** Name of the VLAN.

**Status:** **Static** shows this is a manually configured static VLAN. **Unused** means this VLAN is created by UI/CLI and has no member ports. This VLAN is not workable yet. **Dynamic** means this VLAN is learnt by GVRP.

After created the VLAN, the status of this VLAN will remain in unused status until you add ports to the VLAN.

4.6.5 CLI Commands of the VLAN

Command Lines of the VLAN port configuration, VLAN configuration and VLAN table display

Feature	Command Line
<b>VLAN Port Configuration</b>	
VLAN Port PVID	Switch(config-if)# switchport trunk native vlan 2 Set port default vlan id to 2 success

#### 4.7 Private VLAN

The private VLAN helps to resolve the primary VLAN ID shortage, client ports' isolation and network security issues. The Private VLAN provides primary and secondary VLAN within a single switch.

**Primary VLAN:** The uplink port is usually the primary VLAN. A primary VLAN contains promiscuous ports that can communicate with lower Secondary VLANs.

**Secondary VLAN:** The client ports are usually defined within secondary VLAN. The secondary VLAN includes Isolated VLAN and Community VLAN. The client ports can be isolated VLANs or can be grouped in the same Community VLAN. The ports within the same community VLAN can communicate with each other. However, the isolated VLAN ports cannot.

The figure shows the typical Private VLAN network. The SCADA/Public Server or NMS workstation is usually located in primary VLAN. The clients PCs or Rings are located within Secondary.

Private VLAN (PVLAN) Configuration group enables you to Configure PVLAN, PVLAN Port and see the PVLAN Information.

Following commands are included in this group:

4.7.1 PVLAN Configuration

4.7.2 PVLAN Port Configuration

4.7.3 CLI Commands of the PVLAN

##### 4.7.1 PVLAN Configuration

PVLAN Configuration allows you to assign Private VLAN type. After created VLAN in VLAN configuration page, the available VLAN ID will display here. Choose the Private VLAN types for each VLAN you want configure.

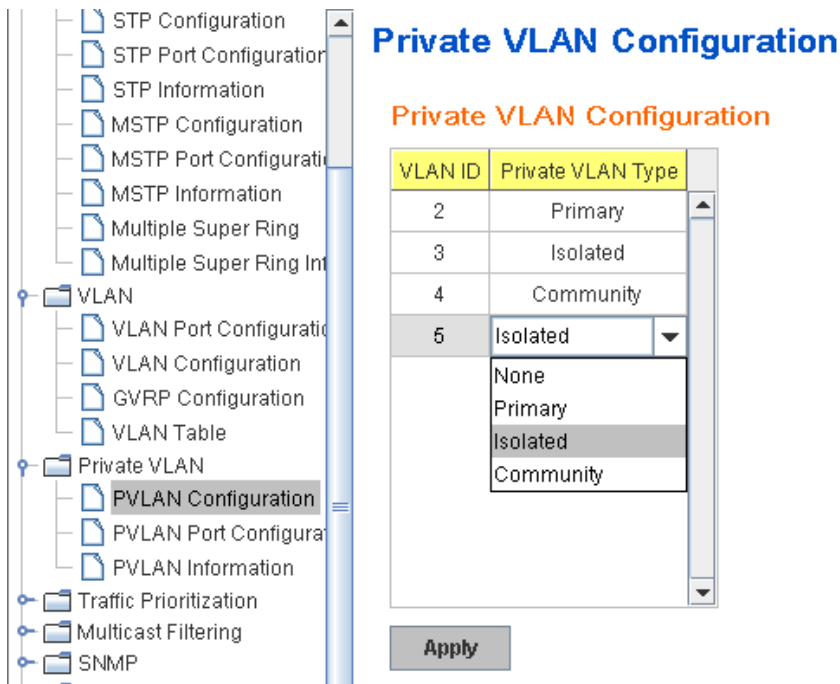

**None:** The VLAN is not included in Private VLAN.

**Primary:** The VLAN is the Primary VLAN. The member ports can communicate with secondary ports.

**Isolated:** The VLAN is the Isolated VLAN. The member ports of the VLAN are isolated.

**Community:** The VLAN is the Community VLAN. The member ports of the VLAN

can communicate with each other.

#### 4.7.2 PVLAN Port Configuration

PVLAN Port Configuration page allows configure Port Configuration and Private VLAN Association.

##### Private VLAN Association (PVLAN)

**Secondary VLAN:** After the Isolated and Community VLAN Type is assigned in Private VLAN Configuration page, the VLANs are belonged to the Secondary VLAN and displayed here.

**Primary VLAN:** After the Primary VLAN Type is assigned in Private VLAN Configuration page, the secondary VLAN can associate to the Primary VLAN ID. Select the Primary VLAN ID here.

**Note:** Before configuring PVLAN port type, the Private VLAN Association should be done first.

##### Port Configuraion

##### **PVLAN Port Type:**

**Normal:** The Normal port is None PVLAN ports, it remains its original VLAN setting.

**Host:** The Host type ports can be mapped to the Secondary VLAN.

**Promiscuous:** The promiscuous port can be associated to the Primary VLAN.

**VLAN ID:** After assigned the port type, the web UI display the available VLAN ID the port can associate to.

For example:

- 1. VLAN Create:** VLAN 2-5 are created in VLAN Configuration page.

**2. Private VLAN Type:** VLAN 2-5 has its Private VLAN Type configured in Private VLAN Configuration page.

VLAN 2 is belonged to Primary VLAN.

VLAN 3-5 are belonged to secondary VLAN (Isolated or Community).

**3. Private VLAN Association:** Associate VLAN 3-5 to VLAN 2 in Private VLAN Association first.

**4. Private VLAN Port configuration**

VLAN 2 – Primary -> The member port of VLAN 2 is promiscuous port.

VLAN 3 – Isolated -> The Host port can be mapped to VLAN 3.

VLAN 4 – Community -> The Host port can be mapped to VLAN 3.

VLAN 5 – Community -> The Host port can be mapped to VLAN 3.

**5. Result:**

VLAN 2 -> VLAN 3, 4, 5; member ports can communicate with ports in secondary VLAN.

VLAN 3 -> VLAN 2, member ports are isolated, but it can communicate with member port of VLAN 2...

VLAN 4 -> VLAN 2, member ports within the community can communicate with each other and communicate with member port of VLAN 2.

VLAN 5 -> VLAN 2, member ports within the community can communicate with each other and communicate with member port of VLAN 2.

**Private VLAN Port Configuration**

**Port Configuration**

Port	PVLAN Port Type	VLAN ID
1	Normal	None
2	Normal	None
3	Normal	None
4	Normal	None
5	Normal	None
6	Normal	None
7	Host	5
8	Host	4
9	Host	3
10	Promiscuous	2

Apply

**Private VLAN Association**

Secondary VLAN	Primary VLAN
3	2
4	2
5	2

4.7.3 Private VLAN Information

This page allows you to see the Private VLAN information.

Private VLAN Information

Private VLAN Information

Primary VLAN	Secondary VLAN	Secondary VLAN Type	Ports
2	3	Isolated	10,9
2	4	Community	10,8
2	5	Community	10,7

#### 4.8 Traffic Prioritization

Quality of Service (QoS) provides traffic prioritization mechanism which allows users to deliver better service to certain flows. QoS can also help to alleviate congestion problems and ensure high-priority traffic is delivered first. This section allows you to configure Traffic Prioritization settings for each port with regard to setting priorities.

JetNet QoS supports 4 physical queues, weighted fair queuing (WRR) and Strict Priority scheme, which follows 802.1p COS tag and IPv4 TOS/DiffServ information to prioritize the traffic of your industrial network.

Following commands are included in this group:

4.8.1 QoS Setting

4.8.2 CoS-Queue Mapping

4.8.3 DSCP-Queue Mapping

4.8.4 CLI Commands of the Traffic Prioritization

4.8.1 QoS Setting

QoS Setting

Queue Scheduling

- Use an 8,4,2,1 weighted fair queuing scheme
- Use a strict priority scheme

Port Setting

Port	CoS	Trust Mode
1	0	COS Only
2	0	COS Only
3	0	COS Only
4	0	COS Only
5	0	COS Only
6	0	COS Only
7	0	COS Only
8	0	COS Only
9	0	COS Only
10	0	COS Only

Apply

- COS Only
- DSCP Only
- COS First
- DSCP First

**Queue Scheduling**

You can select the Queue Scheduling rule as follows:

**Use an 8,4,2,1 weighted fair queuing scheme.** This is also known as **WRR** (Weight Round Robin). JetNet will follow 8:4:2:1 rate to process the packets in a queue from the highest priority to the lowest. For example, the system will process 8 packets with the highest priority in the queue, 4 with middle priority, 2 with low priority, and 1 with the lowest priority at the same time.

**Use a strict priority scheme.** Packets with higher priority in the queue will always be processed first, except that there is no packet with higher priority.

**Port Setting**

**CoS** column is to indicate default port priority value for untagged or priority-tagged frames. When JetNet receives the frames, JetNet will attach the value to the CoS field of the incoming VLAN-tagged packets. You can enable 0,1,2,3,4,5,6 or 7 to the port.

**Trust Mode** is to indicate Queue Mapping types for you to select.

**COS Only:** Port priority will only follow COS-Queue Mapping you have assigned.

**DSCP Only:** Port priority will only follow DSCP-Queue Mapping you have assigned.

**COS first:** Port priority will follow COS-Queue Mapping first, and then DSCP-Queue Mapping rule.

**DSCP first:** Port priority will follow DSCP-Queue Mapping first, and then COS-Queue Mapping rule.

Default priority type is **COS Only**. The system will provide default COS-Queue table to which you can refer for the next command.

After configuration, press **Apply** to enable the settings.

#### 4.8.2 CoS-Queue Mapping

This page is to change CoS values to Physical Queue mapping table. Since the switch fabric of JetNet only supports 4 physical queues, Lowest, Low, Middle and High. Users should therefore assign how to map CoS value to the level of the physical queue.

In JetNet, users can freely assign the mapping table or follow the suggestion of the 802.1p standard. Korenix uses 802.p suggestion as default values. You can find CoS values 1 and 2 are mapped to physical Queue 0, the lowest queue. CoS values 0 and 3 are mapped to physical Queue 1, the low/normal physical queue. CoS values 4 and 5 are mapped to physical Queue 2, the middle physical queue. CoS values 6 and 7 are mapped to physical Queue 3, the high physical queue.

### CoS-Queue Mapping

#### CoS-Queue Mapping

CoS	0	1	2	3	4	5	6	7
Queue	1	0	0	1	2	2	3	3

Note: Queue 3 is the highest priority queue in using Strict Priority scheme.

Apply

- 0
- 1
- 2
- 3

After configuration, press **Apply** to enable the settings.

4.8.3 DSCP-Queue Mapping

This page is to change DSCP values to Physical Queue mapping table. Since the switch fabric of JetNet only supports 4 physical queues, Lowest, Low, Middle and High. Users should therefore assign how to map DSCP value to the level of the physical queue. In JetNet, users can freely change the mapping table to follow the upper layer 3 switch or routers' DSCP setting.

Traffic Prioritization

DSCP-Queue Mapping

DSCP	0	1	2	3	4	5	6	7
Queue	1	1	1	1	1	1	1	1
DSCP	8	9	10	11	12	13	14	15
Queue	0	0	0	0	0	0	0	0
DSCP	16	17	18	19	20	21	22	23
Queue	0	0	0	0	0	0	0	0
DSCP	24	25	26	27	28	29	30	31
Queue	1	1	1	1	1	1	1	1

#### 4.9 Multicast Filtering

For multicast filtering, JetNet Switch uses IGMP Snooping technology. IGMP (Internet Group Management Protocol) is an Internet Protocol that provides a way for internet device to report its multicast group membership to adjacent routers. Multicasting allows one computer on the internet to send data to a multitude of other computers that have identified themselves as being interested in receiving the originating computers data.

Multicasting is useful for such applications as updating the address books of mobile computer users in the field, sending out newsletters to a distribution list, and broadcasting streaming media to an audience that has tuned into the event by setting up multicast group membership.

In effect, IGMP Snooping manages multicast traffic by making use of switches, routers, and hosts that support IGMP. Enabling IGMP Snooping allows the ports to detect IGMP queries, report packets, and manage multicast traffic through the switch. IGMP has three fundamental types of messages, as shown below:

Message	Description
<b>Query</b>	A message sent from the querier (an IGMP router or a switch) which asks for a response from each host that belongs to the multicast group.
<b>Report</b>	A message sent by a host to the querier to indicate that the host wants to be or is a member of a given group indicated in the report message.
<b>Leave Group</b>	A message sent by a host to the querier to indicate that the host has quit as a member of a specific multicast group.

You can enable **IGMP Snooping** and **IGMP Query** functions here. You will see the information of the IGMP Snooping function in this section, including different multicast groups' VID and member ports, and IP multicast addresses that range from 224.0.0.0 to 239.255.255.255.

In this section, Force filtering can determined whether the switch flooding unknown multicast or not.

Following commands are included in this group:

4.9.1 IGMP Snooping

4.9.2 IGMP Query

4.9.3 Force Filtering

4.9.4 CLI Commands of the Multicast Filtering

4.9.1 IGMP Snooping

This page is to enable IGMP Snooping feature, assign IGMP Snooping for specific VLAN, and view IGMP Snooping table from dynamic learnt or static manual key-in. JetNet Switch support IGMP snooping V1/V2/V3 automatically and IGMP query V1/V2.

**IGMP Snooping**

IGMP Snooping: Disable

	VID	IGMP Snooping
<input checked="" type="checkbox"/>	1	Disabled

Select All

**IGMP Snooping**, you can select **Enable** or **Disable** here. After enabling IGMP Snooping, you can then enable IGMP Snooping for specific VLAN. You can enable IGMP Snooping for some VLANs so that some of the VLANs will support IGMP Snooping and others won't.

**IGMP Snooping Table**

IP Address	VID	1	2	3	4	5	6	7	8	9	10
239.255.255.250	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
239.192.8.0	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

To assign IGMP Snooping to VLAN, please select the **checkbox** of VLAN ID or select **all** checkbox for all VLANs. Then press **Enable**. In the same way, you can also **Disable** IGMP Snooping for certain VLANs.

**IGMP Snooping Table:** In the table, you can see multicast group IP address, VLAN ID it belongs to, and member ports of the multicast group. JetNet Managed Switch series supports 256 multicast groups. Click on **Reload** to refresh the table.

IGMP Snooping Table											
IP Address	VID	1	2	3	4	5	6	7	8	9	10

#### 4.9.2 IGMP Query

**IGMP Query on the Management VLAN**

Version	Disable ▾
Query Interval(s)	<input type="text"/>
Query Maximum Response Time(s)	<input type="text"/>

This page allows users to configure **IGMP Query** feature. Since JetNet Switch can only be configured by member ports of the management VLAN, IGMP Query can only be enabled on the management VLAN. If you want to run IGMP Snooping feature in several VLANs, you should notice that whether each VLAN has its own IGMP Querier first.

The IGMP querier periodically sends query packets to all end-stations on the LANs or VLANs that are connected to it. For networks with more than one IGMP querier, a switch with the lowest IP address becomes the IGMP querier.

In IGMP Query selection, you can select V1, V2 or Disable. **V1** means IGMP V1 General Query and **V2** means IGMP V2 General Query. The query will be forwarded to all multicast groups in the VLAN. **Disable** allows you to disable IGMP Query.

**Query Interval(s):** The period of query sent by querier.

**Query Maximum Response Time:** The span querier detect to confirm there are no more directly connected group members on a LAN.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

4.9.3 Force Filtering

The Force filtering function allows the switch to filter the unknown-multicast data flow. If Force filtering is enabled, all the unknown multicast data will be discarded.

4.9.4 CLI Commands of the Multicast Filtering

Command Lines of the multicast filtering configuration

Feature	Command Line
<b>IGMP Snooping</b>

Disable Force filtering	Switch(config)# no mac-address-table multicast filtering Flooding unknown multicast addresses ok!

## 4.10 SNMP

Simple Network Management Protocol (SNMP) is a protocol used for exchanging management information between network devices. SNMP is a member of the TCP/IP protocol suite. JetNet Managed Switch support SNMP v1 and v2c and V3.

An SNMP managed network consists of two main components: agents and a manager. An agent is a management software module that resides in a managed switch. An agent translates the local management information from the managed device into a SNMP compatible format. The manager is the console through the network.

Following commands are included in this group:

### 4.10.1 SNMP Configuration

### 4.10.2 SNMPv3 Profile

### 4.10.3 SNMP Traps

### 4.10.4 SNMP CLI Commands for SNMP

### 4.10.1 SNMP Configuration

This page allows users to configure SNMP V1/V2c Community. The community string can be viewed as the password because SNMP V1/V2c doesn't request you to enter password before you try to access SNMP agent.

The community includes 2 privileges, Read Only and Read and Write.

With **Read Only** privilege, you only have the ability to read the values of MIB tables. Default community string is Public.

With **Read and Write** privilege, you have the ability to read and set the values of MIB tables. Default community string is Private.

JetNet Managed Switch allows users to assign 4 community strings. Type the community string and select the privilege. Then press **Apply**.

**Note:** When you first install the device in your network, we highly recommend you to change the community string. Since most SNMP management application uses Public and Private as their default community name, this might be the leakage of the network security.

## SNMP

### SNMP V1/V2c Community

Community String	Privilege
public	Read Only ▼
private	Read and Write ▼
	Read Only ▼
	Read Only ▼

Apply

#### 4.10.2 SNMP V3 Profile

SNMP v3 can provide more security functions when the user performs remote management through SNMP protocol. It delivers SNMP information to the administrator with user authentication; all of data between *JetNet Switch* and the administrator are encrypted to ensure secure communication.

### SNMP V3 Profile

#### SNMP V3

User Name	<input type="text"/>
Security Level	Authentication ▼
Authentication Portocol	SHA ▼
Authentication Password	<input type="text"/>
DES Encryption Password	<input type="text"/>

Add

**Security Level:** Here the user can select the following levels of security: None, User Authentication, and Authentication with privacy.

**Authentication Protocol:** Here the user can select either MD5 (Message-Digest algorithm 5) or SHA (Secure Hash Algorithm). MD5 is a widely used cryptographic hash function with a 128-bit hash value. SHA (Secure Hash Algorithm) hash functions refer to five Federal Information Processing Standard-approved algorithms for computing a condensed digital representation. *JetNet Managed Switch – 5310G* provides 2 user authentication protocols in MD5 and SHA. You will need to configure SNMP v3 parameters for your SNMP tool with the same authentication method.

**Authentication Password:** Here the user enters the SNMP v3 user authentication

password.

**DES Encryption Password:** Here the user enters the password for SNMP v3 user DES Encryption.

### 4.10.3 SNMP Traps

SNMP Trap is the notification feature defined by SNMP protocol. All the SNMP management applications can understand such trap information. So you don't need to install new application to read the notification information.

This page allows users to **Enable SNMP Trap**, configure the **SNMP Trap server IP**, **Community** name, and trap **Version V1 or V2**. After configuration, you can see the change of the SNMP pre-defined standard traps and Korenix pre-defined traps. The pre-defined traps can be found in Korenix private MIB, that included in the CD-manual or download from Korenix Web-site.

## 4.11 Security

JetNet Switch provides several security features for you to secure your connection. The features include Port Security and IP Security.

Following commands are included in this group:

4.11.1 Port Security

4.11.2 IP Security

4.11.3 IEEE 802.1x

4.11.4 CLI Commands of the Security

### 4.11.1 Port Security

Port Security feature allows you to stop the MAC address learning for specific port. After stopping MAC learning, only the MAC address listed in Port Security List can access the switch and transmit/receive traffic. This is a simple way to secure your network environment and not to be accessed by hackers.

This page allows you to enable Port Security and configure Port Security entry.

**Port Security State:** Change Port Security State of the port to Enable first.

**Add Port Security Entry:** Select the port, and type VID and MAC address. Format of the MAC address is xxxx.xxxx.xxxx. Ex: 0012.7701.0101. Max volume of one port is 10. So the system can accept 100 Port Security MAC addresses in total.

**Port Security List:** This table shows you those enabled port security entries. You can click on **Remove** to delete the entry.

### Port Security

#### Port Security State

Port	State
1	Disable ▼
2	Disable ▼
3	Disable ▼
4	Disable ▼
5	Disable ▼
6	Disable ▼
7	Disable ▼
8	Disable ▼
9	Disable ▼
10	Disable ▼

#### Add Port Security Entry

Port	VID	MAC Address
Port 7 ▼	1	0012.7710.0102

#### Port Security List

All ▼

Port	VID	MAC Address
7	1	0012.7710.0101
7	1	0012.7710.0102

Once you finish configuring the settings, click on **Apply / Add** to apply your configuration.

**4.11.2 IP Security**

In IP Security section, you can set up specific IP addresses to grant authorization for management access to this JetNet via a web browser or Telnet.

**IP Security:** Select Enable and **Apply** to enable IP security function.

**Add Security IP:** You can assign specific IP addresses, and then press **Add**. Only these IP addresses can access and manage JetNet via a web browser or Telnet. Max security IP is 10.

**Security IP List:** This table shows you added security IP addresses. You can press **Remove** to delete, **Reload** to reload the table.

**IP Security**

IP Security

**Apply**

**Add Security IP**

Security IP

**Add**

**Security IP List**

1	192.168.10.33

**Remove** **Reload**

Once you finish configuring the settings, click on **Apply** to apply your configuration.

4.11.3 IEEE 802.1x

4.11.3.1 802.1X configuration

IEEE 802.1X is the protocol that performing authentication to obtain access to IEEE 802 LANs. It is port-base network access control. With the function, JetNet Switch could control which connection is available or not.

### 802.1x Port-Based Network Access Control Configuration

**System Auth Control** Disable ▾

**Authentication Method** Radius ▾

**Radius Server**

RADIUS Server IP	192.168.10.100
Shared Key	radius-key
Server Port	1812
Accounting Port	1813

**Secondary Radius Server**

RADIUS Server IP	
Shared Key	
Server Port	
Accounting Port	

**Local Radius User**

Username	Password	VID

**Local Radius User List**

Username	Password	VID

**System AuthControl:** To enable or disable the 802.1x authentication.

**Authentication Method:** Radius is an authentication server that provide key for authentication, with this method, user must connect switch to server. If user select Local for the authentication method, switch use the local user data base which can be create in this page for authentication.

**Radius Server IP:** The IP address of Radius server

**Shared Key:** it is the password for communicate between switch and Radius Server.

**Server Port:** UDP port of Radius server.

**Accounting Port:** Port for packets that contain the information of account login or logout.

**Secondary Radius Server IP:** Secondary Radius Server could be set in case of the primary radius server down.

**802.1X Local User:** Here User can add Account/Password for local authentication.

**802.1X Local user List:** This is a list shows the account information, User also can remove selected account Here.

4.11.3.2 802.1x Port Configuration

After the configuration of Radius Server or Local user list, user also need configure the authentication mode, authentication behavior, applied VLAN for each port and permitted communication. The following information will explain the port configuration.

**802.1X Port Configuration**

802.1X Port Configuration

Port	Port Control	MAB	Re-authentication	Max Request	Guest VLAN	Host Mode	Admin Control Direction
<input type="checkbox"/> 1	Force Authorized	Disable	Disable	2	0	Single	Both
<input type="checkbox"/> 2	Force Authorized	Disable	Disable	2	0	Single	Both
<input type="checkbox"/> 3	Force Authorized	Disable	Disable	2	0	Single	Both
<input type="checkbox"/> 4	Force Authorized	Disable	Disable	2	0	Single	Both
<input type="checkbox"/> 5	Force Authorized	Disable	Disable	2	0	Single	Both
<input type="checkbox"/> 6	Force Authorized	Disable	Disable	2	0	Single	Both
<input type="checkbox"/> 7	Force Authorized	Disable	Disable	2	0	Single	Both
<input type="checkbox"/> 8	Force Authorized	Disable	Disable	2	0	Single	Both
<input type="checkbox"/> 9	Force Authorized	Disable	Disable	2	0	Single	Both
<input type="checkbox"/> 10	Force Authorized	Disable	Disable	2	0	Single	Both

**802.1X Timeout Configuration**

Port	Re-Auth Period(s)	Quiet Period(s)	Tx period(s)	Supplicant Timeout(s)	Server Timeout(s)
1	3600	60	30	30	30
2	3600	60	30	30	30
3	3600	60	30	30	30
4	3600	60	30	30	30
5	3600	60	30	30	30
6	3600	60	30	30	30
7	3600	60	30	30	30
8	3600	60	30	30	30
9	3600	60	30	30	30
10	3600	60	30	30	30

**Port control:** Force Authorized means this port is authorized; the data is free to in/out. Force unauthorized just opposite, the port is blocked. If users want to control this port with Radius Server, please select Auto for port control.

**MAB:** If this field is auto, the functional MAC Address will bypass to Radius Server for authentication.

**Reauthentication:** If enable this field, switch will ask client to re-authenticate. The default time interval is 3600 seconds.

**Max Request:** the maximum times that the switch allow client request.

**Guest VLAN:** 0 to 4094 is available for this field. If this field is set to 0, that means the port is blocked after authentication fail. Otherwise, the port will be set to

Guest VLAN.

**Host Mode:** if there are more than one device connected to this port, set the Host Mode to single means only the first PC authenticate success can access this port. If this port is set to multi, all the device can access this port once any one of them pass the authentication.

**Control Direction:** determined devices can end data out only or both send and receive.

**Re-Auth Period:** control the Re-authentication time interval, 1~65535 is available.

**Quiet Period:** When authentication failed, Switch will wait for a period and try to communicate with radius server again.

**Tx period:** the time interval of authentication request.

**Supplicant Timeout:** the timeout for the client authenticating

**Sever Timeout:** The timeout for server response for authenticating.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

Click **Initialize Selected** to set the authorize state of selected port to initialize status.

Click **Reauthenticate Selected** to send EAP Request to supplicant to request reauthentication.

Click **Default Selected** to reset the configurable 802.1x parameters of selected port to the default values.

### 4.11.3.3 802.1X Port Status

Here user can observe the port status for Port control status, Authorize Status, Authorized Supplicant and Open Control Direction each port.

**802.1x Port-Based Network Access Control Port Status**

Port	Port Control	Authorize Status	Authorized Supplicant	Oper Control Direction
1	Force Authorized	AUTHORIZED	NONE	Both
2	Force Authorized	AUTHORIZED	NONE	Both
3	Force Authorized	AUTHORIZED	NONE	Both
4	Force Authorized	AUTHORIZED	NONE	Both
5	Force Authorized	AUTHORIZED	NONE	Both

## 4.12 Warning

JetNet Switch provides several types of Warning features for you to remote monitor the status of end devices or the change of your network. The features include Fault Relay, System Log and SMTP E-mail Alert.

Following commands are included in this group:

### 4.12.1 Fault Relay

#### 4.12.2 Event & E-mail warning

##### 4.12.2.1 Event Selection

##### 4.12.2.2 Syslog configuration

##### 4.12.2.2 SMTP Configuration

### 4.12.3 CLI Commands

### 4.12.1 Fault Relay

The JetNet Switch provides 1 alarm relay output, also known as Digital Output. The relay (DO) contact is energized from normal and will form a close circuit under system fault conditions. The fault conditions include power failure, Ethernet port link fault, Ring topology change, Ping Failure, DI state change or ping remote IP address failure.

From the firmware version 1.1a, the fault relay supports multiple event relay binding function. That means fault relay not only support one event only, it can be assigned multiple event. The condition or term described as following table.

Term	condition	description
<b>Power</b>	Power DC1 Power DC2 Any	Detect power input status. If one of condition occurred, relay triggered.
<b>Port Link</b>	Port number	Monitoring port link down event
<b>Ring</b>	Ring failure	If ring topology changed
<b>Ping</b>	<b>IP Address:</b> remote device's IP address.	If target IP does not reply ping request, then relay active.
<b>Ping Reset</b>	<b>IP address:</b> remote device's address <b>Reset Time:</b> duration of output open. <b>Hold Time:</b> duration of Ping hold time.	Ping target device and trigger relay to emulate power reset for remote device, if remote system crash.  Note: once perform Ping reset, the relay output will form a short circuit.
<b>Dry Output</b>	<b>On period:</b> duration of relay output short (close). <b>Off period:</b> duration of relay output open.	Relay continuous perform On/Off behavior with different duration.

DI	DI number (JetNet 5310GG supports 1 DI)	Relay trigger when DI states change to Hi or Low
----	--	--

The Fault relay configuration UI has shown as below:

The relay supports multiple event trigger function; click and select type of event and setting the detail information, and then click the icon “Apply” to active the replay alarm function.

**Relay 1:** Show current relay state. If the relay is triggered, the event type will be marked with the symbol- \*. On the upper diagram, the replay is triggered by power event – Any.

**Power:** relay trigger by power down event. It can be set to monitor power DC1, DC2 and Any.

**Port Link:** monitoring the port link status.

**Ring:** monitoring the ring status.

**Ping:** ping predefined IP address. If the device does not reply the Ping, the relay will be triggered.

**Ping Reset:** the relay active as a power switch for remote device. If the relay alarm function is occupied for the Ping Reset, the other event should be disabled. It may cause the relay wrong action.

**IP address:** device’s IPaddress whose power wiring is connected with relay output.

**Reset Time:** user defined duration of relay contact open to emulate power switch off. After the duration, the relay contact will change to close to emulates power switch on.

**Hold time:** user defined the booting time that device needed. After relay contact close, the Switch will start ping after count down the hold time.

**Dry Output:** forced the relay active as an on/off switch. This function also should not apply with other event.

**On period /Off period:** the duration of relay on and off. The available range of a period is 0-65535 seconds

DI: monitoring the Digital input state.

#### 4.12.2.1 Event & E-mail Warning – Event Selection

Event Types can be divided into two basic groups: System Events and Port Events. System Events are related to the overall function of the switch, whereas Port Events related to the activity of specific ports

<input type="checkbox"/> Device Cold Start	<input type="checkbox"/> Device Warm Start
<input type="checkbox"/> Authentication Failure	<input type="checkbox"/> Time Synchronize Failure
<input type="checkbox"/> Power 1 Failure	<input type="checkbox"/> Power 2 Failure
<input type="checkbox"/> Fault Relay	<input type="checkbox"/> DI1 Change
<input type="checkbox"/> Ring Event	<input type="checkbox"/> Loop Protection
<input type="checkbox"/> SFP	

Once you finish configuring the settings, click on **Apply** to apply your configuration.

Port Event Selection		PoE Event Selection	
Port	Link State	Port	PoE Powering
1	Disable	1	Disable
2	Disable	2	Disable
3	Disable	3	Disable
4	Disable	4	Disable
5	Disable	5	Disable
6	Disable	6	Disable
7	Disable	7	Disable
8	Disable	8	Disable
9	Disable		
10	Disable		

System Event Selection	Warning Event is sent when.....
Device Cold Start	Power is cut off and then reconnected.
Device Warm Start	Reboot the device by CLI or Web UI.
Authentication failure	An incorrect password, SNMP Community String is entered.
Time Synchronize Failure	Accessing to NTP Server is failure.
Power 1/ 2 Failure	The power input is failure.
Fault Relay	The DO/Fault Relay is on.
Ring Topology Changes	Master of Super Ring has changed or backup path is activated.
SFP	The SFP transceiver’s state is abnormal.
Port Event Selection	Warning Event is sent when.....
Link-Up	The port is connected to another device
Link-Down	The port is disconnected (e.g. the cable is pulled out, or the opposing devices turns down)
Both	The link status changed.
PoE Event Selection	Warning Event is sent when.....
Disable	Port PoE function is disabled
Enable	Port PoE function is enabled.

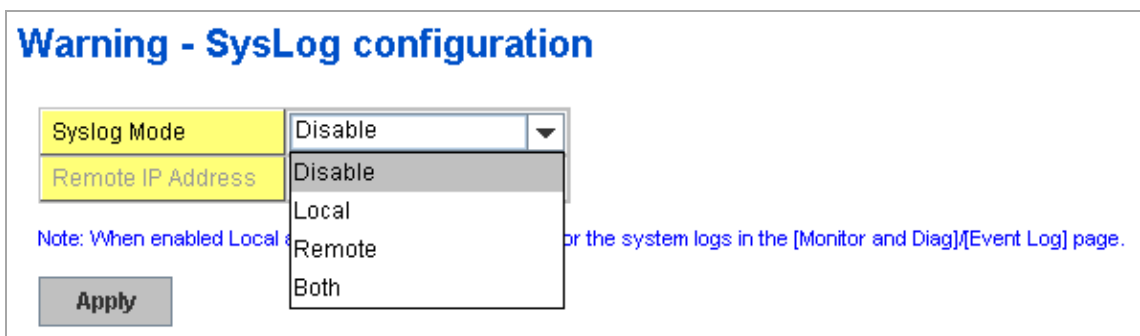

**4.12.2.2 SysLog Configuration**

System Log is useful to provide system administrator locally or remotely monitor switch events history. There are 2 System Log modes provided by JetNet Switch, local mode and remote mode.

**Local Mode:** In this mode, JetNet Switch will print the occurred events selected in the Event Selection page to System Log table of JetNet Switch. You can monitor the system logs in [Monitor and Diag] / [Event Log] page.

**Remote Mode:** The remote mode is also known as Server mode in JetNet managed switch series. In this mode, you should assign the IP address of the System Log server. JetNet Switch will send the occurred events selected in Event Selection page to System Log server you assigned.

**Both:** Above 2 modes can be enabled at the same time.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

***Note:** When enabling Local or Both modes, you can monitor the system logs in [Monitor and Diag] / [Event Log] page.*

**4.12.2.3 SMTP Configuration**

JetNet Switch supports E-mail Warning feature. The switch will send the occurred events to remote E-mail server. The receiver can then receive notification by E-mail. The E-mail warning is conformed to SMTP standard.

This page allows you to enable E-mail Alert, assign the SMTP Server IP, Sender E-mail, and Receiver E-mail. If SMTP server requests you to authorize first, you can also set up the username and password in this page.

**Warning - SMTP Configuration**

**E-mail Alert**      Enable ▼

**SMTP Configuration**

SMTP Server IP	192.168.10.1
Mail Account	admin@korenix.com
<input checked="" type="checkbox"/> Authentication

## 4.13 Monitor and Diag

JetNet Switch provides several types of features for you to monitor the status of the switch or diagnostic for you to check the problem when encountering problems related to the switch. The features include MAC Address Table, Port Statistics, Port Mirror, Event Log and Ping.

Following commands are included in this group:

4.13.1 MAC Address Table

4.13.2 Port Statistics

4.13.3 Port Mirror

4.13.4 Event Log

4.13.5 Topology Discovery

4.13.6 Ping

4.13.7 CLI Commands of the Monitor and Diag

### 4.13.1 MAC Address Table

JetNet 5310G provides 8K entries in MAC Address Table. In this page, users can change the Aging time, add Static Unicast MAC Address, monitor the MAC address or sort them by different packet types and ports. Click on **Apply** to change the value.

#### **Aging Time (Sec)**

Each switch fabric has limit size to write the learnt MAC address. To save more entries for new MAC address, the switch fabric will age out non-used MAC address entry per Aging Time timeout. The default Aging Time is 300 seconds. The Aging Time can be modified in this page.

#### **Static Unicast MAC Address**

In some applications, users may need to type in the static Unicast MAC address to its MAC address table. In this page, you can type MAC Address (format: xxxx.xxxx.xxxx), select its VID and Port ID, and then click on **Add** to add it to MAC Address table.

#### **MAC Address Table**

In this MAC Address Table, you can see all the MAC Addresses learnt by the switch fabric. The packet types include Management Unicast, Static Unicast, Dynamic Unicast, Static Multicast and Dynamic Multicast. The table allows users to sort the address by the packet types and port.

**Packet Types: Management Unicast** means MAC address of the switch. It belongs to CPU port only. **Static Unicast** MAC address can be added and deleted. **Dynamic Unicast** MAC is MAC address learnt by the switch Fabric. **Static Multicast** can be added by CLI and can be deleted by Web and CLI. **Dynamic Multicast** will appear after you enabled IGMP and the switch learnt IGMP report.

Click on **Remove** to remove the static Unicast/Multicast MAC address. Click on **Reload** to refresh the table. New learnt Unicast/Multicast MAC address will be updated to MAC address table.

### MAC Address Table

**Aging Time (Sec)**

**Apply**

**Static Unicast MAC Address**

MAC Address	VID	Port
<input type="text"/>	<input type="text"/>	Port 1 ▾

**Add**

**MAC Address Table**  ▾

**Remove** **Reload**

#### 4.13.2 Port Statistics

In this page, you can view operation statistics for each port. The statistics that can be viewed include Link Type, Link State, Rx Good, Rx Bad, Rx Abort, Tx Good, Tx Bad and Collision. Rx means the received packet while Tx means the transmitted packets.

*Note: If you see many Bad, Abort or Collision counts increased, that may mean your network cable is not connected well, the network performance of the port is poor...etc. Please check your network cable, Network Interface Card of the connected device, the network application, or reallocate the network traffic...etc.*

Click on **Clear Selected** to reinitialize the counts of the selected ports, and **Clear All** to reinitialize the counts of all ports. Click on **Reload** to refresh the counts.

### Port Statistics

Port	Type	Link	State	Rx Good	Rx Bad	Rx Abort	Tx Good	Tx Bad	Collision
1	100BASE	Up	Enable	2435	0	2	12508	0	0
2	100BASE	Down	Enable	0	0	0	0	0	0
3	100BASE	Down	Enable	0	0	0	0	0	0
4	100BASE	Down	Enable	0	0	0	0	0	0
5	100BASE	Down	Enable	0	0	0	0	0	0
6	100BASE	Down	Enable	0	0	0	0	0	0

#### 4.13.3 Port Mirroring

Port mirroring (also called port spanning) is a tool that allows you to mirror the traffic from one or more ports onto another port, without disrupting the flow of traffic on the original port. Any traffic that goes into or out of the Source Port(s) will be duplicated at the Destination Port. This traffic can then be analyzed at the Destination port using a monitoring device or application. A network administrator will typically utilize this tool for diagnostics, debugging, or fending off attacks.

**Port Mirror Mode:** Select Enable/Disable to enable/disable Port Mirror.

**Source Port:** This is also known as Monitor Port. These are the ports you want to monitor. The traffic of all source/monitor ports will be copied to destination/analysis ports. You can choose a single port, or any combination of ports, but you can only monitor them in Rx or TX only. Click on checkbox of the Port ID, RX, Tx or Both to select the source ports.

**Destination Port:** This is also known as Analysis Port. You can analyze the traffic of all the monitored ports at this port without affecting the flow of traffic on the port(s) being monitored. Only one RX/TX of the destination port can be selected. A network administrator would typically connect a LAN analyzer or Netxray device to this port.

Once you finish configuring the settings, click on **Apply** to apply the settings.

**Port Mirroring**

Port Mirror Mode

Port Selection

Port	Source Port		Destination Port	
	Rx	Tx	Rx	Tx
1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="radio"/>	<input type="radio"/>
2	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="radio"/>	<input type="radio"/>
3	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="radio"/>	<input type="radio"/>
4	<input type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>	<input checked="" type="radio"/>
5	<input type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>	<input type="radio"/>
6	<input type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>	<input type="radio"/>
7	<input type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>	<input type="radio"/>
8	<input type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>	<input type="radio"/>
9	<input type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>	<input type="radio"/>
10	<input type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>	<input type="radio"/>

**4.13.4 Event Log**

In the 4.11.3, we have introduced System Log feature. When System Log Local mode is selected, JetNet Switch will record occurred events in local log table. This page shows this log table. The entry includes the index, occurred data and time and content of the events.

Click on **Clear** to clear the entries. Click on **Reload** to refresh the table.

**System Event Logs**

Index	Date	Time	Event Log
1	Jan 1	02:50:53	Event: Link 4 Up.
2	Jan 1	02:50:51	Event: Link 5 Down.
3	Jan 1	02:50:50	Event: Link 5 Up.
4	Jan 1	02:50:47	Event: Link 4 Down.

**4.13.5 Topology Discovery**

JetNet Managed Switch- 5310G support network topology discovery or LLDP (IEEE 802.1AB Link Layer Discovery Protocol) function that can help user to discovery multi-vendor’s network device on same segment by NMS system which supports LLDP function; With LLDP function, NMS can easier maintain the topology map, display port ID, port description, system description, VLAN ID...

Once the link failure, the topology change events can be updated to the NMS as well. The LLDP Port State can display the neighbor ID and IP learnt from the connected devices. You can purchase Korenix JetView Pro iNMS as your network management platform.

Once configured the Management Switch's LLDP setting, it will be auto discover by the NMS platform, like as JetView Pro.

The configuration and settings explain as following.

**LLDP:** Select Enable/Disable to enable/disable LLDP function.

**LLDP Configuration:** To configure the related timer of LLDP.

**LLDP Timer:** the interval time of each LLDP and counts in second; the valid number is from 5 to 254, default is 30 seconds.

**LLDP Hold time:** The TTL (Time to Live) timer. The LLDP state will be expired once the LLDP is not received by the hold time. The default is 120 seconds.

**Local port:** the current port number that linked with neighbor network device.

**Neighbor ID:** the MAC address of neighbor device on the same network segment.

**Neighbor IP:** the IP address of neighbor device on the same network segment.

**Neighbor VID:** the VLAN ID of neighbor device on the same network segment.

### 4.13.6 Ping Utility

This page provides **Ping Utility** for users to ping remote device and check whether the device is alive or not. Type **Target IP** address of the target device and click on **Start** to start the ping. After few seconds, you can see the result in the **Result** field.

### Ping Utility

**Ping**

Target IP

**Result**

```

PING 192.168.10.33 (192.168.10.33): 56 data bytes

## 4.14 Device Front Panel

Device Front Panel commands allows you to see LED status of the switch. You can see LED and link status of the Power, DO, R.M. and Ports.

Feature	LED On	LED Blinking	LED off
Power	Power is on applying	Not available	No power
Sys	System ready	System is on progress firmware upgrade or not ready	System not ready
R.S.	Green on: switch is working as ring master	Red blinking: Ring failed	Switch is working at slave mode.
Alarm	Green on: alarm relay active and contacts is short.	Not available	Green off: relay output contact is open.
LNK/ACT	Port is linked	Port is on transmitting	Port is link down
1000M	The port is linked at 1000Mbps speed.	Not available	Not available
PoE	Green on: powering	On detecting	Power output over current or cable short

**Note: No CLI command for this feature.**

### 4.15 Save to Flash

**Save Configuration** allows you to save any configuration you just made to the Flash. Powering off the switch without clicking on **Save Configuration** will cause loss of new settings. After selecting **Save Configuration**, click on **Save to Flash** to save your new configuration.

Note: This command will permanently save the current configuration to flash.

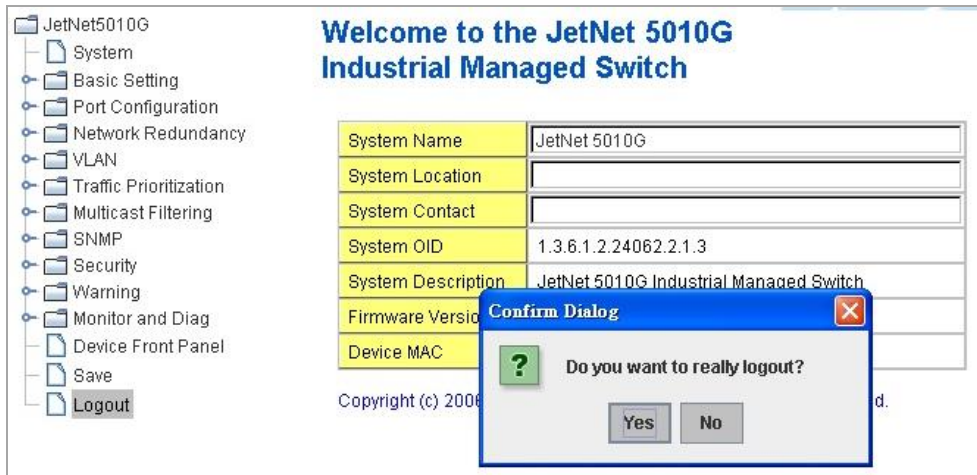

**Command Lines:**

Feature	Command Line
Save	<pre>SWITCH# write Building Configuration... [OK]  Switch# copy running-config startup-config Building Configuration... [OK]</pre>

### 4.16 Logout

The switch provides 2 logout methods. The web connection will be logged out if you don't input any command after 30 seconds. The Logout command allows you to manually logout the web connection. Click on **Yes** to logout, **No** to go back the configuration page. (Refer to following diagram)

**Command Lines:**

Feature	Command Line
Logout	SWITCH> exit
	SWITCH# exit

## 5 Appendix

### 5.1 JetNet 5310G Product Specifications

#### Technology

##### Standard

IEEE 802.3 10 Base-T Ethernet  
 IEEE 802.3u 100 Base-TX Fast Ethernet  
 IEEE 802.3u 100 Base-FX Fast Ethernet Fiber  
 IEEE 802.3ab 1000 Base-T  
 IEEE 802.3z Gigabit Fiber  
 IEEE 802.3x Flow Control and Back-pressure  
 IEEE 802.3af Power over Ethernet  
 IEEE 802.3at High power Power over Ethernet  
 IEEE 802.1AB Link Layer Discovery Protocol (LLDP)  
 IEEE 802.1p Class of Service (CoS)  
 IEEE 802.1Q VLAN and GVRP  
 IEEE 802.1QinQ  
 IEEE 802.1D-2004 Rapid Spanning Tree Protocol (RSTP)  
 IEEE 802.1s Multiple Spanning Tree Protocol (MSTP)  
 IEEE802.3ad Link Aggregation Protocol (LACP)  
 IEEE802.1x Port Based Network Access Protocol  
 IEEE 1588 Precision Time Protocol (PTP)

#### System Performance

##### Switch Technology

Store and Forward Technology with 32Gbps Switch Fabric

##### System Throughput

8.32 Mega packet per second

##### CPU performance

32 bits ARM-9E running at 180 MHz and performance up to 200MIPS;  
 Embedded hardware based watch-dog timer

##### System Memory

8M bytes flash ROM, 64M bytes SDRAM

##### Transfer packet size

64 bytes to 1522 bytes (includes double tag VLAN)

##### MAC Address

8K MAC address table

##### Packet Buffer

1M bits shared memory for packet buffer

##### Transfer performance

14,880pps for Ethernet and 148,800 for Fast Ethernet, 1488,100 for Gigabit Ethernet

##### Environment Monitoring

Embedded board-level thermal detector for system temperature monitoring.

#### System Management

##### Configuration and monitoring interface

Telnet, local RS-232 console, Web- browser interface, SNMP, Trap and SMTP interface. TFTP/Web Update for firmware and configuration backup and restore, DHCP Client, warm reboot, reset to default, Admin password, Port Speed/Duplex Control, status, statistic, MAC address table display, static MAC, Aging time, SNMP v1, v2c, v3, Traps and RMON groups 1,2,3,9.

<b>Telnet &amp; Local Console</b>	Supports command line interface with Cisco like commands and maximum 4 sessions; the telnet interface also supports SSH.
<b>SNMP</b>	Support IPv4/IPv6, v1, v2c, V3 with SNMP trap function, trap station up to 4 and can be manually configured the trap server IP address.
<b>SNMP MIB</b>	MIBII, Bridge MIB, Ethernet-like MIB, VLAN MIB, IGMP MIB, Korenix Private MIB.
<b>Korenix Utility</b>	Supports Korenix View and Korenix NMS with IEEE 802.1AB Link Layer Discovery Protocol for device and link auto-topology discovery
<b>Network Time Protocol</b>	Supports NTP protocol with daylight saving function and localize time sync function.
<b>Management IP Security</b>	IP address security to prevent unauthorized access
<b>Management Secure</b>	IEEE 802.1x Port based network access control: MAB (MAC Authentication Bypass), remote management login authentication by Radius account /password, key for RADIUS server authentication
<b>E-mail Warning</b>	4 receipt E-mail accounts with mail server authentication
<b>System Log</b>	Supports both of Local or remote Server with authentication

### Network Performance

<b>Port Configuration</b>	Port link Speed, Link mode, current status and enable/disable.
<b>Port Trunk</b>	IEEE 802.3ad port aggregation and static port trunk; trunk member up to 8 ports and maximum 5 trunk groups include Gigabit Ethernet port.
<b>VLAN</b>	IEEE 802.1Q Tag VLAN with 256 VLAN Entries and provides 2K GVRP entries, 3 VLAN link modes- Trunk, Hybrid and Link access
<b>IEEE 802.1Q Q-in-Q</b>	Supports Double Tag VLAN function for Metro Network -Private VLAN application
<b>Class of Service</b>	IEEE 802.1p class of service; per port 4 priority queues.
<b>Traffic Prioritize</b>	Supports 4 physical queues, weighted fair queuing (W.R.R.) and Strict Priority scheme, which follows 802.1p CoS tag and IPv4 ToS/ DiffServ information to prioritize the traffic of your industrial network.
<b>IGMP Snooping</b>	IGMP Snooping v1/v2c /v3 for multicast filtering and IGMP Query mode; also support unknown multicasting process forwarding policies- drop, flooding and forward to router port.
<b>Rate Control</b>	Ingress/Egress filtering for Broadcast, Multicast, Unknown DA or All packets.
<b>Port Mirroring</b>	Online traffic monitoring on multiple selected ports
<b>Port Security</b>	Port security to assign authorized MAC to specific port
<b>DHCP</b>	DHCP Client, DHCP Server with IP & MAC Address binding and DHCP agent (option 82), DHCP server relay with circuit ID, Port Based DHCP Server with fixed IP address.
<b>IEEE 802.1x</b>	Port based network access control.
<b>Power over Ethernet</b>	IEEE 802.3af / IEEE 802.3at End-span wiring architecture

PoE Operating Mode	Auto mode: Auto detects and powering by IEEE 802.3af /IEEE 802.3at 2-event/IEEE 802.3at 2-event plus LLDP behaviors Forced mode: User configured power consumption without detection, classification
PoE forwarding conductor	V+: RJ-45 plug's pin conductor 3,6 V-: RJ-45 plug's pin conductor 1,2
Power forwarding ability	IEEE 802.3af: 15.4w /port, IEEE 802.3at:30w/port.
PoE System Power Budget	240W @ 60°C, 95% Humidity, DC 48V power input
Power Budget Control	Port-based system power budget control with first plug-in high priority mechanism.
<b>Network Redundancy</b>	
Multiple Super Ring (MSR) <sup>™</sup>	New generation Korenix Ring Redundancy Technology, Includes Rapid Super Ring (RSR <sup>™</sup> ), Rapid Dual Homing (RDH <sup>™</sup> ), TrunkRing <sup>™</sup> , MultiRing <sup>™</sup> and backward compatible with legacy Super Ring <sup>™</sup> .
Rapid Dual Homing (RDH) <sup>™</sup>	Multiple uplink paths to one or multiple upper switch
TrunkRing <sup>™</sup>	Integrate port aggregate function in ring path to get higher throughput ring architecture
MultiRing <sup>™</sup>	Couple or multiple rings: JetNet 5310G supports up to 4 100Mbps rings and 2 Gigabit rings in single switch.
SuperChain <sup>™</sup>	It is new ring technology with flexible and scalability, compatibility, and easy configurable. The ring includes 2 types of node Switch – Border Switch and Member Switch
Rapid Spanning Tree	IEEE802.1D-2004 Rapid Spanning Tree Protocol. Compatible with Legacy Spanning Tree and IEEE 802.1w multiple spanning tree.
Loop Protection	The Loop Protection prevents any network looping caused by RSTP and MSR ring topology chang
<b>Interface</b>	
Enclosure Port	10/100Mbps PSE port: 8 x RJ-45 Gigabit Ethernet port : 2 x RJ-45 with auto MDI/MDI-X function 100Mbps / 1000Mbps Fiber port : 2 x SFP Socket for SFP fiber transceiver with Hot-swappable and Digital Diagnostic Monitoring (DDM) functions Console port : 1 x RJ-45 for system configuration Digital Input / Relay Output port: 4-Pin removable terminal block connector Power input port: 4-Pin removable terminal block connector
Cables	100 Base-TX: 2-pairs UTP/STP/FTP Cat.5 cable, EIA/TIA-568B 100-ohm (100m) 1000 Base-T: 4-pair UTP/STP/FTP Cat.5e cable, EIA/TIA-568B 100-ohm (100m) Uses STP or FTP cable can provide higher electromagnetic resistance to correspond vertical market standard, such as railway EMC – EN50121-4.
Digital Input	Digital Input (Hi): DC 11V~30V Digital Input (Low): DC 10V~0V Supports sink type signal input with photo-coupler isolation.
Relay Output	Dry Relay output: 0.5A / DC 24V. Supports Multiple Events Binding trigger function.
Diagnostic Indicators	Power: Green On (System power applied) D.I.: Green On (digital signal high level is detected) D.O.: Red On. (relay active and form as short circuit)

Sys: Green On (System Ready), Blinking ( System perform firmware upgrade)

R.S. (Ring status): Green on (Ring normal) / Blinking (Ring with wrong port),  
Yellow on (Ring abnormal) / Blinking (device's ring port failed)

LNK (Link): Green on, ACT (Active): Green Blinking

PoE: Yellow on ( PoE is applying power)

### Power Requirements

System power inquire	Input Range: DC 46~57V; Inrush current: 64A / DC 46V input, 76.4A / DC 57V input.
Power system type	Passive power source
Power Consumption	15Watt without PD loading.

### Mechanical

Installation	DIN-Rail mounting
Case material	Steel metal with Aluminum heat-dissipate panel housing Ingress Protection –grade 30
Dimension (mm)	95 (W) x 127(D) x 160 (H) – w/o DIN Rail Clip 95 (W) x 136.2(D) x 160 (H) – w/ DIN Rail Clip
Weight	1.28Kg

### Environmental

Operating Temperature	-40°C ~75°C:
Operating Humidity	0% ~ 95%, non-condensing
Storage Temperature	-40°C ~ 85°C, 0% ~90% Humidity
Hi-Pot	DC 2.25KV for power to chassis ground, Ethernet port to chassis ground.

### Regulatory Approvals

EMC	IEC /EN61000-6-2, IEC/EN61000-6-4 Heavy Industrial EMC EMI: FCC Class A, CE/ Class A EMS: IEC/EN61000-4-2, IEC/EN61000-4-3, IEC/EN61000-4-4, IEC/EN61000-4-5, IEC/EN61000-4-6, IEC/EN61000-4-8, IEC/EN61000-4-9
Safety	EN60950-1, UL60950-1
Warranty	Global 5 years

## 5.2 Pin assignment of RS-232 serial console cable

The RS-232 console cable includes in the unit box, and the connectors are RJ-45 and DB-9 female.

The following diagram shows the pins assignment of RJ-5 and DB-9 female connectors.

RJ-45 Pin	DB-9 Pin	Description
1	8	N/A
2	9	N/A
3	2	TxD
4	1	N/A
5	5	GND
6	3	RxD
7	4	N/A
8	7	N/A

### DB-9 Female Connector

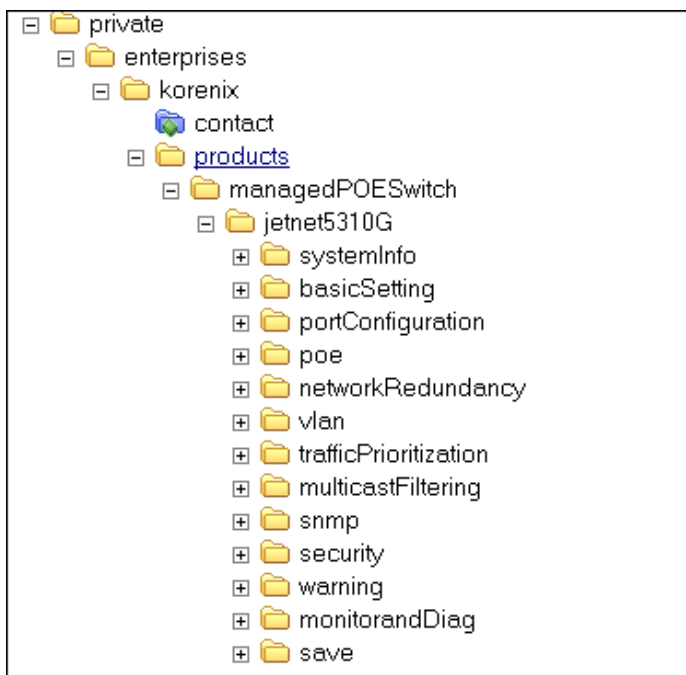

### 5.3 Korenix Private MIB

Korenix provides many standard MIBs for users to configure or monitor the switch's configuration by SNMP. But, since some commands can't be found in standard MIB, Korenix provides Private MIB to meet up the need. Compile the private MIB file by your SNMP tool. You can then use it. Private MIB can be found in product CD or downloaded from Korenix Web site.

Private MIB tree is the same as the web tree. This is easier to understand and use. If you are not familiar with standard MIB, you can directly use private MIB to manage /monitor the switch, no need to learn or find where the OIDs of the commands are.

The path of the JetNet 5310G is 1.3.6.1.4.1.24062.2.3.9. Below is the Private MIB tree for your reference.

**5.4 Revision History**

<b>Edition</b>	<b>Date</b>	<b>Modifications</b>
V01	15-May,2012	New edit and modify from JetNet 6710G user manual.
V02	23-May-2012	Change enclosure appearance diagram, add IEEE 802.1Q Q-in-Q, Private VLAN, and system throughput information. Add IEEE 1588 PTP and Port Based DHCP Server function ( available on Q3 2012)
V03	25-May-2012	Remove IEEE802.3at 1-event plus LLDP and replace by IEEE802.3at 2-event plus LLDP, Multi Ring changes to 2 Gigabit rings. Grammar modify by Armine.
V04	27-Aug-2012	Modify Power connection diagram for UL certificate. Update – install figure with Hot Surface warning information.
V05	31-May-2013	Sync with v1.2a firmware with IPv6 and some enhancements.
V06	20-July-2013	Modify Revision History, and add PoE 120 enabled information PoE 120W output enabled, since firmware V1.2a.
V07	20-OCT-2014	Add Loop Protection, since firmware v1.4.
V08	06-Sept-2017	<ol style="list-style-type: none"> <li>1. Add SuperChain™</li> <li>2. Add MAB function into 4.11.3.2 802.1x Port Configuration</li> <li>3. Modified PoE System Power Budget to 240W @ 60 deg. C</li> </ol>

## 5.5 About Korenix

### **Less Time at Work! Fewer Budget on applications!**

The Korenix business idea is to let you spend less time at work and fewer budget on your applications. Do you really want to go through all the troubles but still end up with low quality products and lousy services? Definitely not! This is why you need Korenix. Korenix offers complete product selection that fulfills all your needs for applications. We provide easier, faster, tailor-made services, and more reliable solutions. In Korenix, there is no need to compromise. Korenix takes care of everything for you!

### **Fusion of Outstanding's**

**You can end** your searching here. Korenix Technology is your one-stop supply center for industrial communications and networking products. Korenix Technology is established by a group of professionals with more than 10 year experience in the arenas of industrial control, data communications and industrial networking applications. Korenix Technology is well-positioned to fulfill your needs and demands by providing a great variety of tailor-made products and services. Korenix's industrial-grade products also come with quality services. No more searching, and no more worries. Korenix Technology stands by you all the way through.

### **Core Strength---Competitive Price and Quality**

With our work experience and in-depth know-how of industrial communications and networking, Korenix Technology is able to combine Asia's research / development ability with competitive production cost and with quality service and support.

### **Global Sales Strategy**

Korenix's global sales strategy focuses on establishing and developing trustworthy relationships with value added distributors and channel partners, and assisting OEM distributors to promote their own brands. Korenix supplies products to match local market requirements of design, quality, sales, marketing and customer services, allowing Korenix and distributors to create and enjoy profits together.

### **Quality Services**

**KoreCARE---** KoreCARE is Korenix Technology's global service center, where our professional staffs are ready to solve your problems at any time and in real-time. All of Korenix's products have passed ISO-9000/EMI/CE/FCC/UL certifications, fully satisfying your demands for product quality under critical industrial environments. Korenix global service center's e-mail is [koreCARE@korenix.com](mailto:koreCARE@korenix.com)

### **5 Years Warranty**

Each of Korenix's product line is designed, produced, and tested with high industrial standard. Korenix warrants that the Product(s) shall be free from defects in materials and workmanship for a period of five (5) years from the date of delivery provided that the Product was properly installed and used. This warranty is voided if defects, malfunctions or failures of the warranted Product are caused by damage resulting from force measure (such as floods, fire, etc.), environmental and atmospheric disturbances, other external forces such as power line disturbances, host computer malfunction, plugging the board in under power, or incorrect cabling; or the warranted Product is misused, abused, or operated, altered and repaired in an unauthorized or improper way

**Business service:** [sales@korenix.com](mailto:sales@korenix.com)

**Customer service:** [koreCARE@korenix.com](mailto:koreCARE@korenix.com)
