Federal Communications Commission (FCC) Statement

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his expense.

The user is cautioned that changes and modifications made to the equipment without approval of the manufacturer could void the user's authority to operate this equipment.

1 Introduction

Welcome to Korenix *JetNet 6528Gf* Industrial 28G Full Gigabit Managed Ethernet Switch User Manual. Following topics are covered in this chapter:

- 1.1 Overview
- 1.2 Major Features
- 1.3 Package Checklist

1.1 Overview

The JetNet 6528Gf Series, the 19-inch Industrial 28G Full Gigabit Managed Ethernet Switch includes JetNet 6528Gf-AC, JetNet 6528Gf-2AC, JetNet 6528Gf-AC-DC24 and JetNet 6528Gf-2DC24.

The JetNet 6528Gf Series is equipped with 24 100/1000TX, 8 100/1000 RJ-45/SFP combo ports, 4 GbE SFP ports. JetNet 6528Gf Series is a special design for control rooms where high-port density and performance are required. The 8 Gigabit Combo port design allows 100/1000 dual speed of copper ports, and the SFP ports accept all types of Gigabit SFP transceivers, including Gigabit SX, LX, LHX, ZX and XD for several connections and distances.

Model Name	Description
JetNet 6528Gf-AC	24 100/1000TX, 8 100/1000 RJ-45/SFP combo ports, 4 GbE SFP ports, Ind. full Gigabit Managed Ethernet Switch, -40~75°C, AC power
JetNet 6528Gf-2AC	24 100/1000TX, 8 100/1000 RJ-45/SFP combo ports, 4 GbE SFP ports, Ind. full Gigabit Managed Ethernet Switch, -40~75°C, dual AC power
JetNet 6528Gf-AC-DC24	24 100/1000TX, 8 100/1000 RJ-45/SFP combo ports, 4 GbE SFP ports, Ind. full Gigabit Managed Ethernet Switch, -40~75°C, AC and DC power
JetNet 6528Gf-2DC24	24 100/1000TX, 8 100/1000 RJ-45/SFP combo ports, 4 GbE SFP ports, Ind. full Gigabit Managed Ethernet Switch, -40~75°C, dual DC power

The device is mounted within the 19 inch rack, along with other 19 inch public servers or other network devices. When the lower industrial switches are aggregated to the JetNet 6528Gf, the 28G design allows connecting up to up to 14 rings. Each of the ring has its own ring redundancy protection. This is a unique and Korenix patent protected ring technology. JetNet 6528Gf is designed as a fan-less rackmount switch with low power consumption

and wide operating temperature. JetNet 6528Gf-AC-DC24/6528Gf-2DC24, the DC input model, allows 24V (18-36V) DC input. JetNet 6528Gf supports Jumbo frame featuring up to 9,216 bytes packet size for large size file transmission. This is the trend for future industrial application requests.

The embedded software supports RSTP and Multiple Super Ring technology for ring redundancy protection. Full layer 2 management features include VLAN, IGMP Snooping, LACP for network control, SNMP, LLDP for network management. Secured access is protected by Port Security, 802.1x and flexible Layer 2/4 Access Control List. With JetNet 6528Gf, you can fulfill the technicians' need of having best solution for the industrial Ethernet infrastructure.

1.2 Major Features

Korenix JetNet 6528Gf has the following major features:

- 16-port 10/100/1000 Base-TX, 8-port Gigabit RJ-45/SFP combo ports (100/1000 Base-TX, 1000Base-X) and 8-port Gigabit SFP ports
- Non-Blocking Switching Performance, no collision or delay when wire-speed transmission
- · Supports Jumbo Frame up to 9,216 byte
- RSTP and Multiple Super Ring (Rapid Super Ring, Rapid Dual Homing, MultiRing, TrunkRing)
- · Maximum 14 Gigabit Rings aggregation capability
- VLAN, LACP, GVRP, QoS, IGMP Snooping, Rate Control, Online Multi Port Mirroring
- Link Layer Discovery Protocol (LLDP), SNMP V1/V2c/V3, RMON and KorenixView Discovering and Management
- Advanced Security supports IP/Port Security, 802.1x and Access Control List
- · Event Notification by E-mail, SNMP Trap, Syslog and Relay Output
- Rigid Aluminum Case complies with IP31
- 90-264VAC or Dual 18-36VDC power input

Note: The detail spec is listed in latest datasheet. Please download the latest datasheet in Korenix Web site.

1.3 Package List

Korenix JetNet 6528Gf Series products are shipped with following items:

JetNet 6528Gf-AC/6528Gf-2AC/6528Gf-AC-DC24 Industrial 28G Full Gigabit Managed Ethernet Switch

```
JetNet 6528Gf (no SFP transceivers)
Rack Mount Kit
Console Cable
Power Cord
QIG
```

JetNet 6528Gf-2DC24 Industrial 28G Full Gigabit Managed Ethernet Switch with 18-36VDC input

```
JetNet 6528Gf-2DC24 (no SFP transceivers)
Rack Mount Kit
Console Cable
QIG
```

If any of the above items are missing or damaged, please contact your local sales representative.

2 Hardware Installation

This chapter includes hardware introduction, installation and configuration information.

Following topics are covered in this chapter:

2.1 Hardware Introduction

Dimension

Panel Layout

Bottom View

- 2.2 Wiring Power Inputs
- 2.3 Wiring Digital Output
- 2.4 Wiring Earth Ground
- 2.5 Wiring Ethernet Ports
- 2.6 Wiring Fiber Ports
- 2.7 Wiring Gigabit Combo Ports
- 2.8 Wiring RS-232 console cable
- 2.9 Rack Mounting Installation
- 2.10 Safety Warming

2.1 Hardware Introduction

LED

R.S MSR status LED:

- 1. MSR in Normal State (Lit Green)
- 2. MSR in Abnormal State (Lit Yellow)
- 3. MSR function not active (Not Lit)
- 4. Incorrect configuration of MSR, ex. ring not connected to ring port (Flashes Green)
- 5. The break has been detected to be local to one of the ports (Flashes Yellow) G1-G24 copper port LED:

10/100/1000 RJ-45: Link/Activity (Lit Green/Flashes Green)

Speed (Yellow on:1000Mbps , Yellow off:10/100Mbps

G17-G28 SFP LED:

Link/Activity (Lit Green/Flashes Green)

Diagnostic LED:

AC/DC Power (Green), Sys (Green), Alarm (Red)

Relay Alarm: 1 set of relay output with current carrying capability of 1A@24V

Alarm Events: Power (AC1, AC2, DC1, DC2) failure, port failure, ping failure, login failure,

RSR topology change

Dimension

JetNet 6528Gf Industrial 28G Full Gigabit Managed Ethernet Switch dimension (W x H x D) is 44mm(H) x 438mm (W) x 375mm (D)

Panel Layout

The front panel includes RJ-45 based RS-232 Console Port, USB port, System & Port

LEDs, Gigabit Ethernet Port Interfaces and Gigabit Combo Port Interfaces

The back panel of the JetNet 6528Gf Industrial 28G Full Gigabit Managed Ethernet

Switch consists of 2 DC power inputs, 2 AC power Inputs and 1 Relay Output.

2.2 Wiring Power Inputs

JetNet 6528Gf provides 2 types power input, AC power input for JetNet 6528Gf-AC/6528Gf-2AC/6528Gf-AC-DC24 and DC power input for JetNet 6528Gf-2DC24. The front power switch can switch off all the power input at the same time.

JetNet JetNet 6528Gf-AC/6528Gf-2AC/6528Gf-AC-DC24 AC Power Input

Connect the attached power cord to the AC power input connector, the available AC power input is range from 90-264VAC.

JetNet 6528Gf-AC-DC24/6528Gf-2DC24 DC Power Input

The suggested power input is 24VDC, the available range is from 18-36VDC. Follow below steps to wire JetNet 6528Gf redundant DC power inputs.

- Insert positive and negative wires into V+ and V- contacts respectively of the terminal block connector.
- 2. Tighten the wire-clamp screws to prevent DC wires from being loosened.
- 3. DC1 and DC2 support polarity reverse protection functions.

Note 1: It is a good practice to turn off input and load power, and to unplug power terminal block before making wire connections. Otherwise, your screwdriver blade can inadvertently short your terminal connections to the grounded enclosure.

Note 2: The range of the suitable DC electric wire is from 12 to 24 AWG.

Note 3: Please follow the V+ and V- indicator to wire. Incorrect wiring would not damage the switch. Incorrect wiring can not power on the switch.

2.3 Wiring Digital Output

JetNet 6528Gf series provides 1 digital output, also known as Relay Output. The relay contacts are energized (open) for normal operation and will close for fault conditions. The fault conditions include power failure, Ethernet port link break or other pre-defined events which can be configured in JetNet 6528Gf UI.

2.4 Wiring Earth Ground

To ensure the system will not be damaged by noise or any electrical shock, we suggest you to make exact connection with JetNet 6528Gf with Earth Ground.

For AC input, the 3 pin include V+, V- and GND. The GND pin must be connected to the earth ground.

For DC input, loosen the earth ground screw by screw drive; then tighten the screw after earth ground wire is connected.

2.5 Wiring Fast Ethernet Ports

JetNet 6528Gf includes 24 RJ-45 Gigabit Ethernet ports. The Gigabit Ethernet ports support 100Base-TX and 1000Base-TX, full or half duplex modes. All the Gigabit Ethernet ports will auto-detect the signal from connected devices to negotiate the link speed and duplex mode. Auto MDI/MDIX allows users to connect another switch, hub or workstation without changing straight through or crossover cables.

Note that crossover cables simply cross-connect the transmit lines at each end to the received lines at the opposite end.

Straight-through Cabling Schematic

Cross-over Cabling Schematic

Note that Ethernet cables use pins 1, 2, 3, and 6 of an 8-pin RJ-45 connector. The signals of these pins are converted by the automatic MDI-X function, as shown in the table below:

Pin MDI-X	Signals	MDI Signals
1	RD+	TD+
2	RD-	TD-
3	TD+	RD+
6	TD-	RD-

Connect one side of an Ethernet cable into any switch port and connect the other side to your attached device. The LNK LED will light up when the cable is correctly connected. Refer to the **LED Indicators** section for descriptions of each LED indicator. Always make sure that the cables between the switches and attached devices (e.g. switch, hub, or workstation) are less than 100 meters (328 feet).

The wiring cable types are as below.

10Base-T: 2-pair UTP/STP Cat. 3, 4, 5 cable, EIA/TIA-568 100-ohm (100m)

100 Base-TX: 2-pair UTP/STP Cat. 5 cable, EIA/TIA-568 100-ohm (100m)

1000 Base-TX: 4-pair UTP/STP Cat. 5 cable, EIA/TIA-568 100-ohm (100m)

2.6 Wiring Fiber Ports

Small Form-factor Pluggable (SFP)

The SFP ports accept standard Gigabit MINI GBIC SFP transceiver. But, to ensure system reliability, **Korenix recommends using the Korenix certificated Gigabit SFP Transceiver.** The web UI will show Unknown vendor type when choosing the SFP which is not certificated by Korenix. The certificated SFP transceiver includes 100Base-FX single/multi mode, 100/Gigabit BIDI/WDM, 1000Base-SX/LX single/multi mode ranger from 550m to 80KM.

The way to connect the SFP transceiver is to Plug in SFP fiber transceiver fist. Cross-connect the transmit channel at each end to the receive channel at the opposite end as illustrated in the figure below. The SPF cage is 2x1 design, check the direction/angle of the fiber transceiver and fiber cable when inserted.

Below figure is the SFP plug-in and SFP Fiber Cable Plug-in Example.

Note: This is a Class 1 Laser/LED product. Don't stare at the Laser/LED Beam.

2.7 Wiring Gigabit Combo Ports

JetNet 6528Gf series includes 24 RJ-45 Gigabit Copper Ethernet ports. The speed of the Gigabit Copper Ethernet port supports 100Base-TX and 1000Base-TX. JetNet 6528Gf equips 8 Gigabit SFP ports combo with Gigabit Ethernet RJ-45 ports. JetNet 6528Gf equips 4 Gigabit SFP ports. The speed of the SFP port supports 100MB and 1000Full Duplex. The available gigabit SFP supports Gigabit Single-mode, Multi-mode, BIDI/WDM single-mode SFP transceivers. (The 100Base-FX is not supported in gigabit combo ports.)

While the SFP transceiver is plugged, the Fiber port has higher priority than copper port and moved to the Fiber mode automatically.

2.8 Wiring RS-232 Console Cable

JetNet 6528Gf attaches one RS-232 RJ-45 to DB-9 cable in the box. Connect the DB-9 connector to the COM port of your PC, open Terminal tool and set up serial settings to 115200, N,8,1. (Baud Rate: 115200/ Parity: None / Data Bit: 8 / Stop Bit: 1) Then you can access CLI interface by console cable.

Note: If you lost the cable, please contact with your sales or follow the pin assignment to buy a new one. The Pin assignment spec is listed in the appendix.

2.9 Rack Mounting Installation

The Rack Mount Kit is attached inside the package.

2.9.1 Attach the brackets to the device by using the screws provided in the Rack Mount kit.

(The picture is JetNet 5628G, the mounting method is the same.)

2.9.2 Mount the device in the 19' rack by using four rack-mounting screws provided by the rack manufacturer.

(The picture is JetNet 5628G, the mounting method is the same.)

When installing multiple switches, mount them in the rack one below the other. It's requested to **reserve 0.5U-1U free space for multiple switches installing in high temperature environment.** This is important to disperse the heat generated by the switch.

Notice when installing:

- Temperature: Check if the rack environment temperature conforms to the specified operating temperature range.
- Mechanical Loading: Do no place any equipment on top of the switch. In high vibration environment, additional rack mounting protection is necessary, like the flat board under/above the switch.
- Grounding: Rack-mounted equipment should be properly grounded.

2.10 Safety Warming

2.10.1 The Equipment intended for installation in a Restricted Access Location.

Restricted Access Location:

This equipment is intended to be installed in a RESTRICTED ACCESS LOCATION only.

2.10.2 The warning test is provided in user manual. Below is the information:

"For tilslutning af de ovrige ledere, se medfolgende installationsvejledning".

"Laite on liitettava suojamaadoitus-koskettimilla varustettuun pistorasiaan"

"Apparatet ma tilkoples jordet stikkontakt"

"Apparaten skall anslutas till jordat uttag"

3 Preparation for Management

JetNet 6528Gf Rackmount Managed Switch provides both in-band and out-band configuration methods. You can configure the switch via RS232 console cable if you don't attach your admin PC to your network, or if you lose network connection to your JetNet 6528Gf. This is so-called out-band management. It wouldn't be affected by network performance.

The in-band management means you can remotely manage the switch via the network. You can choose Telnet or Web-based management. You just need to know the device's IP address and you can remotely connect to its embedded HTTP web pages or Telnet console.

Following topics are covered in this chapter:

- 3.1 Preparation for Serial Console
- 3.2 Preparation for Web Interface
- 3.3 Preparation for Telnet console

3.1 Preparation for Serial Console

In JetNet 6528Gf package, Korenix attached one RS-232 RJ-45 to DB-9 console cable. Please attach RS-232 DB-9 connector to your PC COM port, connect the other end to the Console port of the JetNet 6528Gf. Note: If you lost the cable, please contact with your sales or follow the pin assignment to buy a new one..

- 1. Go to Start -> Program -> Accessories -> Communication -> Hyper Terminal
- 2. Give a name to the new console connection.
- 3. Choose the COM name
- 4. Select correct serial settings. The serial settings of JetNet 6528Gf are as below: Baud Rate: 115200 / Parity: None / Data Bit: 8 / Stop Bit: 1
- 5. After connected, you can see Switch login request.
- 6. Login the switch. The default username is "admin", password, "admin".

Boot Loader Rev 1.0.0.2 for JetNet6528Gf (Oct 05 2015 - 11:12:50) Starting
Switch login: admin Password:
JetNet6528Gf (version 0.0.20-20151215-10:29:12). Copyright 2006-2015 Korenix Technology Co., Ltd.
Switch>

3.2 Preparation for Web Interface

JetNet 6528Gf provides HTTP Web Interface and Secured HTTPS Web Interface for web management.

3.2.1 Web Interface

Korenix web management page is developed by JAVA. It allows you to use a standard web-browser such as Microsoft Internet Explorer, or Mozilla, to configure and interrogate the switch from anywhere on the network.

Before you attempt to use the embedded web interface to manage switch operation, verify that your JetNet 6528Gf Series Rackmount Ethernet Switch is properly installed on your network and that every PC on this network can access the switch via the web browser.

- 1. Verify that your network interface card (NIC) is operational, and that your operating system supports TCP/IP protocol.
- 2. Wire DC power to the switch and connect your switch to your computer.
- 3. Make sure that the switch default IP address is 192.168.10.1.
- 4. Change your computer IP address to 192.168.10.2 or other IP address which is located in the 192.168.10.x (Network Mask: 255.255.255.0) subnet.
- 5. Switch to DOS command mode and ping 192.168.10.1 to verify a normal response time.

Launch the web browser and Login.

- 6. Launch the web browser (Internet Explorer or Mozilla Firefox) on the PC.
- 7. Type http://192.168.10.1 (or the IP address of the switch). And then press Enter.
- 8. The login screen will appear next.
- 9. Key in user name and the password. Default user name and password are both **admin**.

Click on **Enter** or **OK**. Welcome page of the web-based management interface will then appear.

Welcome to the JetNet6528Gf-2AC Industrial Managed Switch

System Name	Switch
System Location	
System Contact	
System OID	1.3.6.1.4.1.24062.2.4.2
System Description	JetNet6528Gf-2AC Industrial Managed Ethernet Switch
Firmware Version	v0.0.21 20151221
Device MAC	00:12:77:FF:88:88

Copyright (c) 2006-2015 Korenix Technology Co., Ltd.. All Rights Reserved.

Once you enter the web-based management interface, you can freely change the JetNet's IP address to fit your network environment.

Note 1: IE 5.0 or later versions do not allow Java applets to open sockets by default. Users have to directly modify the browser settings to selectively enable Java applets to use network ports.

Note 2: The Web UI connection session of JetNet 6528Gf will be logged out automatically if you don't give any input after 30 seconds. After logged out, you should re-login and key in correct user name and password again.

3.2.2 Secured Web Interface

Korenix web management page also provides secured management HTTPS login. All the configuration commands will be secured and will be hard for the hackers to sniff the login password and configuration commands.

Launch the web browser and Login.

- 1. Launch the web browser (Internet Explorer or Mozilla Firefox) on the PC.
- 2. Type https://192.168.10.1 (or the IP address of the switch). And then press Enter.
- 3. The popup screen will appear and request you to trust the secured HTTPS

connection distributed by JetNet 6528Gf first. Press Yes to trust it.

4. The login screen will appear next.

- 5. Key in the user name and the password. The default user name and password is **admin**.
- 6. Click on **Enter** or **OK.** Welcome page of the web-based management interface will then appear.
- 7. Once you enter the web-based management interface, all the commands you see are the same as what you see by HTTP login.

3.3 Preparation for Telnet Console

3.3.1 Telnet

Korenix JetNet 6528Gf supports Telnet console. You can connect to the switch by Telnet and the command lines are the same as what you see by RS232 console port. Below are the steps to open Telnet connection to the switch.

- 1. Go to Start -> Run -> cmd. And then press Enter
- Type the Telnet 192.168.10.1 (or the IP address of the switch). And then press Enter

3.3.2 SSH (Secure Shell)

Korenix JetNet 6528Gf also support SSH console. You can remotely connect to the switch by command line interface. The SSH connection can secure all the configuration commands you sent to the switch.

SSH is a client/server architecture while JetNet 6528Gf is the SSH server. When you want to make SSH connection with the switch, you should download the SSH client tool first.

SSH Client

There are many free, sharewares, trials or charged SSH clients you can find on the internet. Fox example, PuTTY is a free and popular Telnet/SSH client. We'll use this tool to demonstrate how to login JetNet by SSH. Note: *PuTTY* is copyright 1997-2006

Simon Tatham.

Download PuTTY: http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html

The copyright of PuTTY

 Open SSH Client/PuTTY. In the Session configuration, enter the Host Name (IP Address of your JetNet 6528Gf) and Port number (default = 22). Choose the "SSH" protocol. Then click on "Open" to start the SSH session console.

2. After click on **Open**, then you can see the cipher information in the popup screen. Press **Yes** to accept the Security Alert.

3. After few seconds, the SSH connection to JetNet 6528Gf is opened. You can see the login screen as the below figure.

- 4. Type the Login Name and its Password. The default Login Name and Password are admin / admin.
- 5. All the commands you see in SSH are the same as the CLI commands you see via RS232 console. The next chapter will introduce in detail how to use command line to configure the switch.

4 Feature Configuration

This chapter explains how to configure JetNet 6528Gf software features. There are four ways to access the switch: Serial console, Telnet, Web browser and SNMP.

JetNet 6528Gf series Rackmount Managed Switch provides both in-band and out-band configuration methods. You can configure the switch via RS232 console cable if you don't attach your admin PC to your network, or if you lose the network connection to your JetNet 6528Gf. This is so-called out-band management. It wouldn't be affected by the network performance.

The in-band management means you can remotely manage the switch via the network. You can choose Telnet or Web-based management. You just need to know the device's IP address. Then you can remotely connect to its embedded HTML web pages or Telnet console.

Korenix web management page is developed by JAVA. It allows you to use a standard web-browser such as Microsoft Internet Explorer, or Mozila, to configure and interrogate the switch from anywhere on the network.

Note: IE 5.0 or later versions do not allow Java applets to open sockets by default. Users have to directly modify the browser settings to selectively enable Java applets to use network ports.

Following topics are covered in this chapter:

- 4.1 Command Line Interface (CLI) Introduction
- 4.2 Basic Setting
- 4.3 Port Configuration
- 4.4 Network Redundancy
- 4.5 VLAN
- 4.6 Private VLAN
- 4.7 Traffic Prioritization
- 4.8 Multicast Filtering
- 4.9 SNMP
- 4.10 Security
- 4.11 Warning
- 4.12 Monitor and Diagnostic
- 4.13 Device Front Panel
- 4.14 Save to Flash
- 4.15 Logout

4.1 Command Line Interface Introduction

The Command Line Interface (CLI) is the user interface to the switch's embedded software system. You can view the system information, show the status, configure the switch and receive a response back from the system by keying in a command.

There are some different command modes. Each command mode has its own access ability, available command lines and uses different command lines to enter and exit. These modes are User EXEC, Privileged EXEC, Global Configuration, (Port/VLAN) Interface Configuration modes.

User EXEC mode: As long as you login the switch by CLI. You are in the User EXEC mode. You can ping, telnet remote device, and show some basic information.

Type enable to enter next mode, exit to logout. ? to see the command list

Switch>

enable Turn on privileged mode command

exit Exit current mode and down to previous mode

list Print command list ping Send echo messages

quit Exit current mode and down to previous mode

show Show running system information

telnet Open a telnet connection traceroute Trace route to destination

Privileged EXEC mode: Press enable in the User EXEC mode, then you can enter the Privileged EXEC mode. In this mode, the system allows you to view current configuration, reset default, reload switch, show system information, save configuration...and enter the global configuration mode.

Type configure terminal to enter next mode, exit to leave. ? to see the command list

Switch#

archive manage archive files clear Reset functions

clock Configure time-of-day clock configure Configuration from vty interface Copy Copy from one file to another

debug Debugging functions (see also 'undebug')

dir Display a list of files

disable Turn off privileged mode command

dot1x IEEE 802.1x standard access security control end End current mode and change to enable mode exit Exit current mode and down to previous mode

list Print command list

mac MAC interface commands

no Negate a command or set its defaults

pager Terminal pager ping Send echo messages

quit Exit current mode and down to previous mode

reboot Reboot system

reload copy a default-config file to replace the current one

show Show running system information

telnet Open a telnet connection terminal Set terminal line parameters traceroute Trace route to destination usb USB

write Write running configuration to memory, network, or terminal

Global Configuration Mode: Press **configure terminal** in privileged EXEC mode. You can then enter global configuration mode. In global configuration mode, you can configure all the features that the system provides you.

Type **interface IFNAME/VLAN** to enter interface configuration mode, **exit** to leave. **?** to see the command list.

Available command lists of global configuration mode.

Switch# configure terminal

Here are some useful commands for you to see these available commands. Save your time in typing and avoid typing error.

? To see all the available commands in this mode. It helps you to see the next command you can/should type as well.

Switch(config)# interface (?)
IFNAME Interface's name
vlan Select a vlan to configure

(Character)? To see all the available commands starts from this character.

Switch(config)# a?
access-list Add an access list entry
administrator Administrator account setting
auth Authentication

Tab This tab key helps you to input the command quicker. If there is only one available command in the next, clicking on tab key can help to finish typing soon.

Switch# con (tab) (tab)
Switch# configure terminal
Switch(config)# ac (tab)
Switch(config)# access-list

- Ctrl+C To stop executing the unfinished command.
- Ctrl+S To lock the screen of the terminal. You can't input any command.
- Ctrl+Q To unlock the screen which is locked by Ctrl+S.
- Ctrl+Z To exit configuration mode.

Alert message when multiple users want to configure the switch. If the administrator is in configuration mode, then the Web users can't change the settings. JetNet 6528Gf allows only one administrator to configure the switch at a time.

4.2 Basic Setting

The Basic Setting group provides you to configure switch information, IP address, User name/Password of the system. It also allows you to do firmware upgrade, backup and restore configuration, reload factory default, and reboot the system.

Following commands are included in this group:

- 4.2.1 Switch Setting
- 4.2.2 Admin Password
- 4.2.3 IP Configuration
- 4.2.4 Time Setting
- 4.2.5 Jumbo Frame
- 4.2.6 DHCP Server
- 4.2.7 Backup and Restore
- 4.2.8 Firmware Upgrade
- 4.2.9 Load Default
- 4.2.10 System Reboot
- 4.2.11 CLI Commands for Basic Setting

4.2.1 Switch Setting

You can assign System name, Location, Contact and view system information.

Switch Setting

System Name	Switch			
System Location				
System Contact				
System OID	1.3.6.1.4.1.24062.2.4.2			
System Description	JetNet6528Gf-2AC Industrial Managed Ethernet Switch			
Firmware Version	v0.0.21 20151221			
Device MAC	00:12:77:FF:88:88			
Apply				

Figure 4.2.1.1 – Web UI of the Switch Setting

System Name: You can assign a name to the device. The available characters you can input is 64. After you configure the name, CLI system will select the first 12 characters as the name in CLI system.

System Location: You can specify the switch's physical location here. The available characters you can input are 64.

System Contact: You can specify contact people here. You can type the name, mail address or other information of the administrator. The available characters you can input

are 64.

System OID: The SNMP object ID of the switch. You can follow the path to find its private MIB in MIB browser. (**Note:** When you attempt to view private MIB, you should compile private MIB files into your MIB browser first.)

System Description: JetNet 6528Gf Industrial Managed Switch is the name of this product.

Firmware Version: Display the firmware version installed in this device.

MAC Address: Display unique hardware address (MAC address) assigned by the manufacturer.

Once you finish the configuration, click on Apply to apply your settings.

Note: Always remember to select **Save** to save your settings. Otherwise, the settings you made will be lost when the switch is powered off.

4.2.2 Admin Password

You can change the user name and the password here to enhance security.

Admin Password

Figure 4.2.2.1 Web UI of the Admin Password

User name: You can key in new user name here. The default setting is **admin**.

Password: You can key in new password here. The default setting is admin.

Confirm Password: You need to type the new password again to confirm it.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

.

Figure 4.2.2.2 Popup alert window for Incorrect Username

4.2.3 IP Configuration

This function allows users to configure the switch's IP address settings.

IP Configuration

DHCP Client: You can select to **Enable** or **Disable** DHCP Client function. When DHCP Client function is enabled, an IP address will be assigned to the switch from the network's DHCP server. In this mode, the default IP address will therefore be replaced by the one assigned by DHCP server. If DHCP Client is disabled, then the IP address that you specified will be used instead.

IP Address: You can assign the IP address reserved by your network for your JetNet switch. If DHCP Client function is enabled, you don't need to assign an IP address to the JetNet switch, as it will be overwritten by DHCP server and shown here. The default IP is 192.168.10.1.

Subnet Mask: You can assign the subnet mask for the IP address here. If DHCP Client function is enabled, you don't need to assign the subnet mask. The default Subnet Mask is 255.255.255.0. **Note:** In the CLI, we use the enabled bit of the subnet mask to represent the number displayed in web UI. For example, 8 stands for 255.0.0.0; 16 stands for 255.255.0.0; 24 stands for 255.255.255.0.

Default Gateway: You can assign the gateway for the switch here. The default gateway is 192.168.10.254. **Note:** In CLI, we use 0.0.0.0/0 to represent for the default gateway.

DNS: You can assign the DNS for the switch here.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

IPv6 Configuration –An IPv6 address is represented as eight groups of four hexadecimal digits, each group representing 16 bits (two octets). The groups are separated by colons (:), and the length of IPv6 address is 128bits.

An example of an IPv6 address is: 2001:0db8:85a3:0000:0000:8a2e:0370:7334.

The Leading zeroes in a group may be omitted. Thus, for example, a IPv6 link-local address may be written as: fe80::212:77ff:fe60:ca90.

IPv6 Configuration

IPv6 Address field: typing new IPv6 address in this field.

Prefix: the size of subnet or network, and it equivalent to the subnet mask, but written in different. The default subnet mask length is 64bits, and written in decimal value -64.

Add: after add new IPv6 address and prefix, don't forget click icon-"**Add**" to apply new address to system.

Remove: select existed IPv6 address and click icon-"Remove" to delete IP address.

Reload: refresh and reload IPv6 address listing.

IPv6 Default Gateway: assign the IPv6 default gateway here. Type IPv6 address of the gateway then click "**Apply**". Note: In CLI, we user ::/0 to represent for the IPv6 default gateway.

IPv6 Default Gateway

IPv6Neighbor Table: shows the IPv6 address of neighbor, connected interface, MAC address of remote IPv6 device, and current state of neighbor device.

IPv6 Neighbor Table

Neighbor	Interface	MAC address	State
fe80::212:77ff:feff:101	vlan1	00:12:77:ff:01:01	REACHABI
fe80::212:77ff:feff:101	vlan1	00:12;77:ff:01:01	REA

The system will update IPv6 Neighbor Table automatically, and user also can click the icon "**Reload**" to refresh the table.

4.2.4 Time Setting

Time Setting source allow user to set the time manually or through NTP server. Network Time Protocol (NTP) is used to synchronize computer clocks on the internet. You can configure NTP settings here to synchronize the clocks of several switches on the network.

The IEEE1588 PTP (Precision Time Protocol) supports very precise time synchronization in an Ethernet network. There are two clocks, Master and Slave. The master device periodically launches an exchange of messages with slave devices to help each slave clock re-compute the offset between its clock and the master's clock.

*Note: Please enable one synchronization protocol (PTP/NTP) only.

JetNet 6528Gf series also provides Daylight Saving function for some territories use.

Time Setting

System Time: Thu Jan 1 01:04:30 2015

Manual Setting: User can select "**Manual setting**" to change time as user wants. User also can click the button "**Get Time from PC**" to get PC's time setting for switch. After click the "**Get Time from PC**" and apply the setting, the System time display the same time as your PC's time.

NTP client: Select the Time Setting Source to NTP client can let device enable the NTP client service. NTP client will be automatically enabled if you change Time source to NTP Client. The system will send request packet to acquire current time from the NTP server you assigned.

Time Setting Source	NTP Client ▼
NTP Client	Manual Setting
Primary Server Address	NTP Client 1192.108.10.120
Secondary Server Address	192.168.10.121

IEEE 1588: select the **PTP State** to enable this function and select one operating mode for the precision time synchronizes.

Daylight Saving Time: Set when Enable Daylight Saving Time start and end, during the Daylight Saving Time, the device's time is one hour earlier than the actual time.

Once you finish your configuration, click on **Apply** to apply your configuration.

4.2.5 Jumbo Frame

74 (GMT+13:00) Nuku'alofa

The switch allows you configure the size of the MTU, Maximum Transmission Unit. The default value is 1,518 bytes. The maximum Jumbo Frame size is 9,216 bytes. You can freely change the available packet size.

Jumbo Frame Setting

MTU size (<64-9216> bytes)

	Size	
1	9216	•
2	1500	
3	5566	
4	1518	=
5	1518	
6	1518	
7	1518	
8	1518	
9	1518	
10	1518	•

Once you finish your configuration, click on **Apply** to apply your configuration.

4.2.6 DHCP Server

Apply

You can select to Enable or Disable DHCP Server function. JetNet 6528Gf will assign a

new IP address to link partners.

DHCP Server configuration

After selecting to enable DHCP Server function, type in the Network IP address for the DHCP server IP pool, Subnet Mask, Default Gateway address and Lease Time for client.

Once you have finished the configuration, click **Apply** to apply your configuration

Excluded Address:

You can type a specific address into the **IP Address field** for the DHCP server reserved IP address.

The IP address that is listed in the **Excluded Address List Table** will not be assigned to the network device. Add or remove an IP address from the **Excluded Address List** by clicking **Add** or **Remove**.

Excluded Address IP Address Add Excluded Address List Index IP Address 1 192.168.10.200 Remove

Manual Binding: *JetNet 6528Gf* provides a MAC address and IP address binding and removing function. You can type in the specified IP and MAC address, then click **Add** to add a new MAC&IP address binding rule for a specified link partner, like PLC or any device without **DHCP client** function. To remove from the binding list, just select the rule to

remove and click Remove.

Manual Binding IP Address MAC Address Add Manual Binding List Index IP Address MAC Address

Remove

DHCP Leased Entries: *JetNet 6528Gf* provides an assigned IP address list for user check. It will show the MAC and IP address that was assigned by *JetNet 6528Gf*. Click the **Reload** button to refresh the listing.

DHCP Leased Entries

Option82 IP Address Configuration: The DHCP can assign IP address according to DHCP Option82 which sent from DHCP Relay Agent.

DHCP Relay Agent: The DHCP Relay Agent is also known as DHCP Option 82. It can help relay the DHCP Request to remote DHCP server located in different subnet.

Note: The DHCP Server can not act with DHCP Relay Agent at the same time.

Relay Agent: Choose Enable or Disable the relay agent.

Relay Policy: The Relay Policy is used when the DHCP request is relayed through more than one switch. The switch can drop, keep or replace the MAC address of the DHCP Request packet.

Helper Address: Type the IP address of the target DHCP Server. There are 4 available IP addresses.

DHCP Option82: You can configure the DHCP Option82 setting of the Relay Agent. Choose 'Default' or you can input any string for Circuit-ID and Remote-ID. By default, Circuit-ID is the combination of VLAN-ID/Port number. Remote-ID is the MAC address of Relay Agent.

4.2.7 Backup and Restore

With Backup command, you can save current configuration file saved in the switch's flash to admin PC or TFTP server. This will allow you to go to **Restore** command later to restore the configuration file back to the switch. Before you restore the configuration file, you must place the backup configuration file in the PC or TFTP server. The switch will then download this file back to the flash.

There are 3 modes for users to backup/restore the configuration file, Local File mode, TFTP Server mode and USB mode.

Local File mode: In this mode, the switch acts as the file server. Users can browse the target folder and then type the file name to backup the configuration. Users can also browse the target folder and select existed configuration file to restore the configuration back to the switch. This mode is only provided by Web UI while CLI is not supported.

TFTP Server mode: In this mode, the switch acts as TFTP client. Before you do so, make sure that your TFTP server is ready. Then please type the IP address of TFTP Server and Backup configuration file name. This mode can be used in both CLI and Web UI.

USB mode: In this mode, the switch acts as USB control viewer. Before you do so, make sure that your USB already inserted into the switch. Then please select the file to Backup configuration file name, or to Restore Configuration. This mode can be used in both CLI and Web UI.

TFTP Server IP Address: You need to key in the IP address of your TFTP Server here.

Backup/Restore File Name: Please type the correct file name of the configuration file.

Configuration File: The configuration file of the switch is a pure text file. You can open it by word/txt read file. You can also modify the file, add/remove the configuration settings, and then restore back to the switch.

Startup Configuration File: After you saved the running-config to flash, the new settings will be kept and work after power cycle. You can use *show startup-config* to view it in CLI.

The Backup command can only backup such configuration file to your PC or TFTP server.

Technical Tip:

Default Configuration File: The switch provides the default configuration file in the system. You can use Reset button, Reload command to reset the system.

Running Configuration File: The switch's CLI allows you to view the latest settings running by the system. The information shown here is the settings you set up but haven't saved to flash. The settings not yet saved to flash will not work after power recycle. You can use show running-config to view it in CLI.

Once you finish selecting and configuring the settings, click on **Backup** or **Restore** to run

Figure 4.2.5.1 Main UI of Backup & Restore

Figure 4.2.5.2 Bacup/Restore Configuration – Local File mode.

Click on Folder icon to select the target file you want to backup/restore.

Note that the folders of the path to the target file do not allow you to input space key.

Figure 4.2.5.3 Backup/Restore Configuration – TFTP Server mode

Type the IP address of TFTP Server IP. Then click on **Backup/Restore**. **Note:** point to the wrong file will cause the entire configuration missed

USB mode: please select the file to Backup configuration file name, or to Restore Configuration.

4.2.8 Firmware Upgrade

In this section, you can update the latest firmware for your switch. Korenix provides the latest firmware in Korenix Web site. The new firmware may include new features, bug fixes

or other software changes. We'll also provide the release notes for the update as well. For technical viewpoint, we suggest you use the latest firmware before installing the switch to the customer site.

Note that the system will be automatically rebooted after you finished upgrading new firmware. Please remind the attached users before you do this.

Firmware Upgrade

System Firmware Version: v0.0.21 20151221
System Firmware Date: 20151218-10:59:11

Note: When firmware upgrade is finished, the switch will restart automatically.

Upgrade

Figure 4.2.5.1 Main UI of Firmware Upgrade

There are 3 modes for users to backup/restore the configuration file, Local File mode, TFTP Server mode and USB storage mode.

Local File mode: In this mode, the switch acts as the file server. Users can browse the target folder and then type the file name to backup the configuration. Users also can browse the target folder and select the existed configuration file to restore the configuration back to the switch. This mode is only provided by Web UI while CLI is not supported.

TFTP Server mode: In this mode, the switch acts as the TFTP client. Before you do so, make sure that your TFTP server is ready. And then please type the IP address of TFTP Server IP address. This mode can be used in both CLI and Web UI.

USB storage mode. In this mode, the switch acts as USB control viewer. Before you do so, make sure that your USB already inserted into the switch. Then please select the firmware file name, then type the upgrade button to upgrade the firmware. This mode can be used in both CLI and Web UI.

TFTP Server IP Address: You need to key in the IP address of your TFTP Server here.

Firmware File Name: The file name of the new firmware.

The UI also shows you the current firmware version and built date of current firmware. Please check the version number after the switch is rebooted.

Figure 4.2.6.2 Firmware Upgrade – Local File mode.

Click on Folder icon to select the target firmware file you want to upgrade.

Figure 4.2.6.3 Warning Message.

Figure 4.2.6.3 Error Message due to the file error or not a firmware for the switch.

Before upgrading firmware, please check the file name and switch model name first and

carefully. Korenix switch provide protection when upgrading incorrect firmware file, the system would not crash even download the incorrect firmware. Even we have the protection, we still ask you don't try/test upgrade incorrect firmware; the unexpected event may occur or damage the system.

Figure 4.2.6.5 Firmware Upgrade – TFTP Server mode.

Type the IP address of TFTP Server and Firmware File Name. Then click on **Upgrade** to start the process.

After finishing transmitting the firmware, the system will copy the firmware file and replace the firmware in the flash. The CLI show until the process is finished.

Firmware Upgrade

System Firmware Version: vstone1218
System Firmware Date: 20151218-10:59:11

Note: When firmware upgrade is finished, the switch will restart automatically.

Select the firmware file name, then type the upgrade button to upgrade the firmware. It will start the firmware upgrade process.

After finishing transmitting the firmware, the system will copy the firmware file and replace the firmware in the flash. The CLI show until the process is finished.

4.2.9 Load Default

In this section, you can reset all the configurations of the switch to default setting. Click on **Reset** the system will then reset all configurations to default setting. The system will show you popup message window after finishing this command. Default setting will work after rebooting the switch.

Figure 4.2.7.1 The main screen of the Reset to Default

Figure 4.2.7.2 Popup alert screen to confirm the command. Click on Yes to start it.

Figure 4.2.7.2 Popup message screen to show you that have done the command. Click on **OK** to close the screen. Then please go to **Reboot** page to reboot the switch.

Click on OK. The system will then auto reboot the device.

Note: If you already configured the IP of your device to other IP address, when you use this command by CLI and Web UI, our software will not reset the IP address to default IP. The system will remain the IP address so that you can still connect the switch via the network.

4.2.10 System Reboot

System Reboot allows you to reboot the device. Some of the feature changes require you to reboot the system. Click on **Reboot** to reboot your device.

Note: Remember to click on **Save** button to save your settings. Otherwise, the settings you made will be gone when the switch is powered off.

Figure 4.2.8.1 Main screen for Rebooting

Reboot Please click [Reboot] button to restart switch device. Reboot

Figure 4.2.8.2 Pop-up alert screen to request confirmation. Click on **Yes**. Then the switch will be rebooted immediately.

Figure 4.2.8.3 Pop-up message screen appears when rebooting the switch...

Note: Since different browser may has different behavior. If the Web GUI don't re-login well, please manually type the IP Address and login the system again.

4.2.11 CLI Commands for Basic Setting

4.3 Port Configuration

Port Configuration group enables you to enable/disable port state, or configure port auto-negotiation, speed, and duplex, flow control, rate limit control and port aggregation settings. It also allows you to view port status and aggregation information.

Following commands are included in this group:

- 4.3.1 Understand the port mapping
- 4.3.2 Port Control
- 4.3.3 Port Status
- 4.3.4 Rate Control
- 4.3.5 Storm Control
- 4.3.6 Port Trunking
- 4.3.7 Command Lines for Port Configuration

4.3.1 Understand the port mapping

Before configuring the port settings, understand the port number in JetNet 6528Gf first.

There are 24 Gigabit Ethernet ports. In Web UI, choose the port number you want to configure, the available number from port 1~24. In CLI, use gi1, gi2...gi24 to present port 1 to port 24

As to the Gigabit Compo ports, it always uses port 25, 26, 27 and 28. In CLI use gi25, gi26, gi27 and gi28 to present the port 25-28.

4.3.2 Port Control

Port Control commands allow you to enable/disable port state, or configure the port auto-negotiation, speed, duplex and flow control.

Figure 4.3.2.1 The main Web UI of the Port Configuration.

Port Control

Port	State	Speed/Duplex	Flow Control	MDIX	Description
10	Enable	Auto Negotiation	Disable	Auto	*
11	Enable	Auto Negotiation	Disable	Auto	
12	Enable	Auto Negotiation	Disable	Auto	
13	Enable	Auto Negotiation	Disable	Auto	
14	Enable	Auto Negotiation	Disable	Auto	
15	Enable	Auto Negotiation	Disable	Auto	
16	Enable	Auto Negotiation	Disable	Auto	
17	Enable	Auto Negotiation	Disable	Auto	
18	Enable	Auto Negotiation	Disable	Auto	
19	Enable	Auto Negotiation	Disable	Auto	

Select the port you want to configure and make changes to the port.

In **State** column, you can enable or disable the state of this port. Once you disable, the port stop to link to the other end and stop to forward any traffic. The default setting is Enable which means all the ports are workable when you receive the device.

In **Speed/Duplex** column, you can configure port speed and duplex mode of this port. Below are the selections you can choose:

Gigabit Ethernet Port 1~24 (gi1~gi24): AutoNegotiation, 10M Full Duplex(10 Full), 10M Half Duplex(10 Half), 100M Full Duplex(100 Full), 100M Half Duplex(100 Half), 1000M Full Duplex(1000 Full), and 1000M Half Duplex(1000 Half)

Gigabit Ethernet Combo Port 25~28: (gi25~gi28): AutoNegotiation, 10M Full Duplex(10 Full), 10M Half Duplex(10 Half), 100M Full Duplex(100 Full), 100M Half Duplex(1000 Half), 1000M Full Duplex(1000 Full), and 1000M Half Duplex(1000 Half).

The default mode is Auto Negotiation mode.

Note: The on board Gigabit SFP port (SFP 25, 26, 27 and 28) in JetNet 6528Gf support 100M and 1000M Full mode.

In **Flow Control** column, "Symmetric" means that you need to activate the flow control function of the remote network device in order to let the flow control of that corresponding port on the switch to work. "Disable" means that you don't need to activate the flow control function of the remote network device, as the flow control of that corresponding port on the switch will work anyway.

In **Description** column, you can add description for the port. You can know the target it attached to easier in remote.

Once you finish configuring the settings, click on **Apply** to save the configuration.

Technical Tips: If both ends are not at the same speed, they can't link with each other. If both ends are not in the same duplex mode, they will be connected by half mode.

4.3.3 Port Status

Port Status shows you current port status after negotiated.

Port Status

Port	Туре	Link	State	Speed/Duplex	Flow Control	
1	1000BASE-TX	Up	Enable	1000 Full	Disable	•
2	1000BASE	Down	Enable		Disable	
3	1000BASE	Down	Enable		Disable	
4	1000BASE	Down	Enable		Disable	Ш
5	1000BASE	Down	Enable		Disable	
6	1000BASE	Down	Enable		Disable	
7	1000BASE	Down	Enable		Disable	
8	1000BASE	Down	Enable		Disable	
9	1000BASE	Down	Enable		Disable	
10	1000BASE	Down	Enable		Disable	v

Reload

Figure 4.3.3.1 shows you the port status. The description of the columns is as below:

Port: Port interface number.

Type: 100BASE-TX -> Fast Ethernet copper port. 100BASE-FX -> 100Base-FX Fiber Port.

1000BASE-TX -> Gigabit Ethernet Copper port. 1000BASE-X-> Gigabit Fiber Port

Link: Link status. Up -> Link UP. Down -> Link Down.

State: Enable -> State is enabled. Disable -> The port is disable/shutdown.

Speed/Duplex: Current working status of the port.

Flow Control: The state of the flow control.

Note: The UI can display vendor name, wave length and distance of all Korenix Gigabit SFP transceiver family. If you see Unknown information, it may mean that the vendor doesn't provide their information or that the information of their transceiver can't be read.

4.3.4 Rate Control

Rate limiting is a form of flow control used to enforce a strict bandwidth limit at a port. You can program separate transmit (Egress Rule) and receive (Ingress Rule) rate limits at each port, and even apply the limit to certain packet types as described below.

Figure 4.3.4.1 shows you the Limit Rate of Ingress and Egress. You can type the volume in the blank. The volume of the JetNet 6528Gf is step by 64Kbps.

Rate Control

Limit Packet Rate

Port	Ingress Rate(Kbps)	Egress Rate(Kbps)	
1	128	128	•
2	0	0	
3	0	0	
4	0	0	
5	0	0	
6	0	0	
7	0	0	
8	0	0	
9	0	0	
10	0	0	•

Apply

4.3.5 Storm Control

The Storm Control is similar to Rate Control. Rate Control filters all the traffic over the threshold you input by UI. Storm Control allows user to define the Rate for specific Packet Types.

Figure 4.3.5.1

Storm Control

Rate Configuration

Broadcast Rate(Kbytes/sec)	2000
DLF Rate(Kbytes/sec)	2000
Multicast Rate(Kbytes/sec)	2000

Port Configuration

Packet type: You can assign the Rate for specific packet types based on packet number per second. The packet types of the Ingress Rule listed here include **Broadcast**, **DLF** (**Destination Lookup Failure**) and **Multicast**. Choose **Enable/Disable** to enable or disable the storm control of specific port.

Rate: This column allows you to manually assign the limit rate of the port. The unit is packets per second. The limit range is from 1 to 262143 packets/sec.

Enter the Rate field of the port you want assign, type the new value and click Enter key first. After assigned or changed the value for all the ports you want configure. Click on **Apply** to apply the configuration of all ports. The Apply command applied all the ports' storm control value, it may take some time and the web interface become slow, this is normal condition.

4.3.6 Port Trunking

Port Trunking configuration allows you to group multiple Ethernet ports in parallel to increase link bandwidth. The aggregated ports can be viewed as one physical port so that the bandwidth is higher than merely one single Ethernet port. The member ports of the same trunk group can balance the loading and backup for each other. Port Trunking feature is usually used when you need higher bandwidth for backbone network. This is an inexpensive way for you to transfer more data.

There are some different descriptions for the port trunking. Different manufacturers may use different descriptions for their products, like Link Aggregation Group (LAG), Link Aggregation Control Protocol, Ethernet Trunk, Ether Channel...etc. Most of the implementations now conform to IEEE standard, 802.3ad.

The aggregated ports can interconnect to the other switch which also supports Port Trunking. Korenix Supports 2 types of port trunking. One is Static Trunk, the other is 802.3ad. When the other end uses 802.3ad LACP, you **should** assign 802.3ad LACP to the trunk. When the other end uses non-802.3ad, you can then use Static Trunk. **In practical, the Static Trunk is suggested.**

There are 2 configuration pages, Aggregation Setting and Aggregation Status.

Aggregation Setting

Port Trunk - Aggregation Setting

Port	Group ID	Trunk Type	
1	None	Static	•
2	None	Static	
3	None	Static	=
4	None	Static	
5	None	Static	
6	None	Static	
7	None	Static	
8	None	Static	
9	None	Static	
10	None	Static	•

Trunk ID	Load Balance Type	
Trunk 1	src-dst-mac	•
Trunk 2	src-dst-mac	
Trunk 3	src-dst-mac	
Trunk 4	src-dst-mac	
Trunk 5	src-dst-mac	
Trunk 6	src-dst-mac	
Trunk 7	src-dst-mac	
Trunk 8	src-dst-mac	•

Note: The port parameters of the trunk members should be the same. The Load Balance Type could be changed after enable Trunk or LACP.

Apply

Trunk Size: The switch can support up to 8 trunk groups. Each trunk group can support up to 8 member ports. Since the member ports should use same speed/duplex, the maximum trunk size is decided by the port volume.

Group ID: Group ID is the ID for the port trunking group. Ports with same group ID are in the same group. Click None, you can select the Trunk ID from Trunk 1 to Trunk 8.

Trunk Type: Static and **802.3ad LACP.** Each Trunk Group can only support Static or 802.3ad LACP. Choose the type you need here. The not active port can't be setup here.

Load Balance Type: Each Trunk Group can support srcMAC, dstMAC, srcIP, dstIP and it's combination.

src-mac -> load distribution is based on the source MAC address

dst-mac -> load distribution is based on the destination-MAC address

src-dst-mac -> load distribution is based on the source and destination MAC address

src-ip -> load distribution is based on the source IP address

dst-ip -> load distribution is based on the destination IP address

src-dst-ip -> load distribution is based on the source and destination IP address

Extended setting in CLI:

Port Priority: The command allows you to change the port priority setting of the specific port. LACP port priority is configured on each port using LACP. The port priority can be configured through the CLI. The higher the number, the lower the priority. The default value is 32768.

LACP Timeout: The LACPDU is generated and continue transmit within the LACP group. The interval time of the LACPDU Long timeout is 30 sec, this is default setting. The LACPDP Short timeout is 1 sec, the command to change from Long to Short is only applied to the CLI, the web GUI doesn't support this. Once the LACP port doesn't receive the LACPDP 3 times, that means the port may leave the group without earlier inform or does not detect by the switch, then the port will be removed from the group.

This command can be used when connect the switch by 2-port LACP through not-direct connected or shared media, like the Wireless AP or Hub. The end of the switch may not directly detect the failure, the LACP Short Timeout can detect the LACP group failure earlier within 3 seconds.

Aggregation Status

This page shows the status of port aggregation. Once the aggregation ports are negotiated well, you will see following status.

Port Trunk - Aggregation Information

Group ID	Туре	Aggregated Ports	Individual Ports	Link Down Ports	
Trunk 1	Static	1		2,3,4	•
Trunk 2	LACP		8	9,10	
Trunk 3					
Trunk 4					
Trunk 5					
Trunk 6					
Trunk 7					
Trunk 8					¥

Group ID: Display Trunk 1 to Trunk 8 set up in Aggregation Setting.

Type: Static or LACP set up in Aggregation Setting.

Aggregated: When LACP links well, you can see the member ports in Aggregated column

Individual: When LACP is enabled, member ports of LACP group which are not connected to correct LACP member ports will be displayed in the Individual column.

Link Down: When LACP is enabled, member ports of LACP group which are not linked up will be displayed in the Link Down column.

4.3.7 Command Lines for Port Configuration

Feature	Command Line	
Port Control		
Port Control – State	Switch(config-if)# shutdown -> Disable pointerface gigabitethernet1 is shutdown now.	ort state

4.4 Network Redundancy

It is critical for industrial applications that network remains non-stop. Korenix develops multiple kinds of standard (STP, RSTP and MSTP) and Korenix patterned redundancy protocol, Multiple Super Ring to remain the network redundancy can be protected well by Korenix switch.

The JetNet 6528Gf Series supports advanced Multiple Spanning Tree Protocol (MSTP). This protocol is a direct extension of RSTP. It can provide an independent spanning tree for different VLANs. It simplifies network management, provides for even faster convergence than RSTP by limiting the size of each region, and prevents VLAN members from being segmented from the rest of the group (as sometimes occurs with IEEE 802.1D STP).

Multiple Super Ring (MSR) technology is *Korenix's* 3rd generation Ring redundancy technology. This is patented and protected by *Korenix* and is used in countries all over the world. MSR ranks the fastest restore and failover time in the world, 0 ms for restore and about 5 milliseconds for failover for copper.

The single Korenix switch can aggregate multiple Rings within one switch. All the ports can be configured as the ring port of a ring, each ring has its own Ring ID and the Ring ID will be added to the watchdog packet to monitor the ring status. This is Korenix Patterned MultiRing Technology.

The Ring ports can be LACP/Port Trunking ports, after aggregated ports to a group, the group of ports can act as the Ring port of the Ring. This is Korenix Patterned TrunkRing Technology.

Advanced Rapid Dual Homing(RDH) technology also facilitates *JetNet switch* to connect with a core managed switch easily and conveniently. With RDH technology, you can also couple several Rapid Super Rings or RSTP cloud together.

Following commands are included in this group:

- 4.4.1 STP Configuration
- 4.4.2 STP Port Configuration
- 4.4.3 STP Information
- 4.4.4 MSTP Configuration
- 4.4.5 MSTP Port Configuration
- 4.4.6 MSTP information
- 4.4.7 Multiple Super Ring
- 4.4.8 Multiple Super Ring Information
- 4.4.9 ERPS Configuration
- 4.4.10 Command Lines for Network Redundancy

The STP Configuration, STP Port Configuration and STP Information pages are available while select the STP and RSTP mode.

The MSTP Configuration, MSTP Port Configuration and MSTP Information pages are available while select the MSTP mode.

The Multiple Super Ring and Multiple Super Ring Information are available while select the MSR mode.

4.4.1 STP Configuration

This page allows select the STP mode and configuring the global STP/RSTP Bridge Configuration.

The STP mode includes the **STP**, **RSTP**, **MSTP** and **Disable**. Please select the STP mode for your system first. The default mode is RSTP enabled.

After select the STP or RSTP mode, continue to configure the global Bridge parameters for STP and RSTP.

After select the MSTP mode, please go to MSTP Configuration page.

Figure 4.4.1.1 show the web page which allows you to select the STP mode, configure the global STP/RSTP/MSTP settings.

STP Mode RSTP • **Bridge Configuration** Bridge Address 0012.7700.0000 32768 **Bridge Priority** • Max Age 20 ¥ Hello Time 2 Forward Delay 15 Apply

STP Configuration

RSTP (Refer to the 4.4.1 of previous version manual.)

RSTP is the abbreviation of Rapid Spanning Tree Protocol. If a switch has more than one path to a destination, it will lead to message loops that can generate broadcast storms and quickly bog down a network. The spanning tree was created to combat the negative effects of message loops in switched networks. A spanning tree uses a spanning tree algorithm (STA) to automatically sense whether a switch has more than one way to communicate with a node. It will then select the best path (primary), and block the other path(s). It will also keep track of the blocked path(s) in case the primary path fails. Spanning Tree Protocol (STP) introduced a standard method to accomplish this. It is specified in IEEE 802.1D-1998. Later, Rapid Spanning Tree Protocol (RSTP) was adopted and represents the evolution of STP, providing much faster spanning tree convergence after a topology change. This is specified in IEEE 802.1w. In 2004, 802.1w is included into 802.1D-2004 version. This switch supports both RSTP and STP (all switches that support RSTP are also backward compatible with switches that support only STP).

Bridge Configuration

Priority (0-61440): RSTP uses bridge ID to determine the root bridge, the bridge with the highest bridge ID becomes the root bridge. The bridge ID is composed of bridge priority and bridge MAC address. So that the bridge with the highest priority becomes the highest

bridge ID. If all the bridge ID has the same priority, the bridge with the lowest MAC address will then become the root bridge.

Note: The bridge priority value must be in multiples of 4096. A device with a lower number has a higher bridge priority. Ex: 4096 is higher than 32768.

Note: The Web GUI allows user select the priority number directly. This is the convinent of the GUI design. When you configure the value through the CLI or SNMP, you may need to type the value directly. Please follow the n x 4096 ruls for the Bridge Priority.

Max Age (6-40): Enter a value from 6 to 40 seconds here. This value represents the time that a bridge will wait without receiving Spanning Tree Protocol configuration messages before attempting to reconfigure.

If JetNet is not the root bridge, and if it has not received a hello message from the root bridge in an amount of time equal to Max Age, then JetNet will reconfigure itself as a root bridge. Once two or more devices on the network are recognized as a root bridge, the devices will renegotiate to set up a new spanning tree topology.

The MAX Age value affects the maximum volume of the RSTP loop. In the RSTP BPDU packet, there is one field, message age which start from 0, add 1 after passed one hop in the RSTP loop. When the message age is larger than MAX Age, the BPDU would be ignored and the lower switches are separated to different RSTP domain. The switches in other RSTP domain can't be managed through upper switch.

Since different RSTP aware switches may have their own mechanism to calculate the message age. So that this is most possibly occurred when interoperate different vendors' RSTP aware switches together. The maximum volume of the Korenix RSTP domain is 23, configure the MAX Age lower than 23 is recommended.

Hello Time (1-10): Enter a value from 1 to 10 seconds here. This is a periodic timer that drives the switch to send out BPDU (Bridge Protocol Data Unit) packet to check current STP status.

The root bridge of the spanning tree topology periodically sends out a "hello" message to other devices on the network to check if the topology is "healthy". The "hello time" is the amount of time the root has waited during sending hello messages.

Forward Delay Time (4-30): Enter a value between 4 and 30 seconds. This value is the time that a port waits before changing from Spanning Tree Protocol learning and listening states to forwarding state.

This is the amount of time JetNet will wait before checking to see if it should be changed to a different state.

Once you have completed your configuration, click on **Apply** to apply your settings.

Note: You must observe the following rule to configure Hello Time, Forwarding Delay, and Max Age parameter

2 × (Forward Delay Time - 1 sec) ≥ Max Age Time ≥ 2 × (Hello Time value + 1 sec)

4.4.2 STP Port Configuration

This page allows you to configure the port parameter after enabled STP or RSTP.

Port Configuration

Select the port you want to configure and you will be able to view current settings and status of the port.

Path Cost: Enter a number between 1 and 200,000,000. This value represents the "cost" of the path to the other bridge from the transmitting bridge at the specified port.

Priority: Enter a value between 0 and 240, using multiples of 16. This is the value that

decides which port should be blocked by priority in a LAN.

Link Type: There are 3 types for you select. Auto, P2P and Share.

Some of the rapid state transitions that are possible within RSTP depend upon whether the port of concern can only be connected to another bridge (i.e. it is served by a point-to-point LAN segment), or if it can be connected to two or more bridges (i.e. it is served by a shared-medium LAN segment). This function allows link status of the link to be manipulated administratively. "Auto" means to auto select P2P or Share mode. "P2P" means P2P is enabled, the 2 ends work in Full duplex mode. While "Share" is enabled, it means P2P is disabled, the 2 ends may connect through a share media and work in Half duplex mode.

Edge Port: A port directly connected to the end stations cannot create a bridging loop in the network. To configure this port as an edge port, set the port to the **Enable** state. When the non-bridge device connects an admin edge port, this port will be in blocking state and turn to forwarding state in 4 seconds.

STP Port Configuration

Port	STP State	Path Cost	Priority	Link Type	Edge Port	
1	Enable	100	128	Auto	Enable	
2	Enable	20000	128	Auto	Enable	
3	Enable	20000	128	Auto	Enable	
4	Enable	20000	128	Auto	Enable	Ц
5	Enable	20000	128	Auto	Enable	
6	Enable	20000	128	Auto	Enable	
7	Enable	20000	128	Auto	Enable	
8	Enable	20000	128	Auto	Enable	
9	Enable	20000	128	Auto	Enable	
10	Enable	20000	128	Auto	Enable	•

Apply

Once you finish your configuration, click on **Apply** to save your settings.

4.4.3 RSTP Info

This page allows you to see the information of the root switch and port status.

RSTP Information

Root Information

Bridge ID	8000.0012.7760.1455
Root Priority	32768
Root Port	N/A
Root Path Cost	0
Max Age(6-40)	20 sec
Hello Time(1-10)	2 sec
Forward Delay(4-30)	15 sec

Port Information

Port	Role	Port State	Path Cost	Port Priority	Oper P2P	Oper Edge	Aggregated(ID/Type)	
1		Disabled	200000	128	P2P	Edge		•
2		Disabled	200000	128	Shared	Edge

10	Designated	Forwarding	20000	128	P2P	Edge		₹

Root Information: You can see root Bridge ID, Root Priority, Root Port, Root Path Cost and the Max Age, Hello Time and Forward Delay of BPDU sent from the root switch.

Port Information: You can see port Role, Port State, Path Cost, Port Priority, Oper P2P mode, Oper edge port mode and Aggregated(ID/Type).

4.4.4 MSTP (Multiple Spanning Tree Protocol) Configuration

MSTP is the abbreviation of Multiple Spanning Tree Protocol. This protocol is a direct extension of RSTP. It can provide an independent spanning tree for different VLANs. It simplifies network management, provides for even faster convergence than RSTP by limiting the size of each region, and prevents VLAN members from being segmented from the rest of the group (as sometimes occurs with IEEE 802.1D STP).

While using MSTP, there are some new concepts of network architecture. A switch may belong to different groups, act as root or designate switch, generate BPDU for the network to maintain the forwarding table of the spanning tree. With MSTP can also provide multiple forwarding paths and enable load balancing. Understand the architecture allows you to maintain the correct spanning tree and operate effectively.

One VLAN can be mapped to a Multiple Spanning Tree Instance (MSTI). For example, the

maximum Instance JetNet supports is usually 16, range from 0-15. The MSTP builds a separate Multiple Spanning Tree (MST) for each instance to maintain connectivity among each of the assigned VLAN groups. An Internal Spanning Tree (IST) is used to connect all the MSTP switches within an MST region. An MST Region may contain multiple MSTP Instances.

The figure shows there are 2 VLANs/MSTP Instances and each instance has its Root and forwarding paths.

A Common Spanning Tree (CST) interconnects all adjacent MST regions and acts as a virtual bridge node for communications with STP or RSTP nodes in the global network. MSTP connects all bridges and LAN segments with a single Common and Internal Spanning Tree (CIST). The CIST is formed as a result of the running spanning tree algorithm between switches that support the STP, RSTP, MSTP protocols.

The figure shows the CST large network. In this network, a Region may has different instances and its own forwarding path and table, however, it acts as a single Bridge of CST.

To configure the MSTP setting, the STP Mode of the STP Configuration page should be changed to MSTP mode first.

STP Configuration

After enabled MSTP mode, then you can go to the MSTP Configuration pages.

MSTP Region Configuration

This page allows configure the Region Name and its Revision, mapping the VLAN to Instance and check current MST Instance configuration. The network can be divided virtually to different Regions. The switches within the Region should have the same Region and Revision level.

Region Name: The name for the Region. Maximum length: 32 characters.

Revision: The revision for the Region. Range: 0-65535; Default: 0)

Once you finish your configuration, click on **Apply** to apply your settings.

New MST Instance

This page allows mapping the VLAN to Instance and assign priority to the instance. Before mapping VLAN to Instance, you should create VLAN and assign the member ports first. Please refer to the VLAN setting page.

MSTP Configuration

MST Region Configuration

Region Name Revision	Korenix 0				
Apply					
New MST Instanc	New MST Instance				
Instance ID	1				
VLAN Group					
Instance Priority	32768				
Add					

Instance ID: Select the Instance ID, the available number is 1-15.

VLAN Group: Type the VLAN ID you want mapping to the instance.

Instance Priority: Assign the priority to the instance.

After finish your configuration, click on Add to apply your settings.

Current MST Instance Configuration

This page allows you to see the current MST Instance Configuration you added. Click on "**Apply**" to apply the setting. You can "**Remove**" the instance or "**Reload**" the configuration display in this page.

Current MST Instance Configuration

Instance		Instance
Instance	VLAN Group

	2	02700
2	3	32768
		02.00
		•
Apply	Remove R	teload

4.4.5 MSTP Port Configuration

This page allows configure the Port settings. Choose the Instance ID you want to configure. The MSTP enabled and linked up ports within the instance will be listed in this table.

Note that the ports not belonged to the Instance, or the ports not MSTP activated will not display. The meaning of the Path Cost, Priority, Link Type and Edge Port is the same as the definition of RSTP.

MSTP Port Configuration

Path Cost: Enter a number between 1 and 200,000,000. This value represents the "cost" of the path to the other bridge from the transmitting bridge at the specified port.

Priority: Enter a value between 0 and 240, using multiples of 16. This is the value that decides which port should be blocked by priority in a LAN.

Link Type: There are 3 types for you select. **Auto, P2P** and **Share.**

Some of the rapid state transitions that are possible within RSTP depend upon whether the port of concern can only be connected to another bridge (i.e. it is served by a point-to-point LAN segment), or if it can be connected to two or more bridges (i.e. it is served by a shared-medium LAN segment). This function allows link status of the link to be manipulated administratively. "Auto" means to auto select P2P or Share mode. "P2P" means P2P is enabled, the 2 ends work in Full duplex mode. While "Share" is enabled, it means P2P is disabled, the 2 ends may connect through a share media and work in Half duplex mode.

Edge: A port directly connected to the end stations cannot create a bridging loop in the network. To configure this port as an edge port, set the port to the **Enable** state. When the non-bridge device connects an admin edge port, this port will be in blocking state and turn to forwarding state in 4 seconds.

Once you finish your configuration, click on Apply to save your settings.

4.4.6 MSTP Information

This page allows you to see the current MSTP information.

Choose the **Instance ID** first. If the instance is not added, the information remains blank.

The **Root Information** shows the setting of the Root switch.

The **Port Information** shows the port setting and status of the ports within the instance.

MSTP Information

4.4.7 Multiple Super Ring (MSR)

The most common industrial network redundancy is to form a ring or loop. Typically, the managed switches are connected in series and the last switch is connected back to the first one. In such connection, you can implement Korenix Multiple Super Ring technology to get fastest recovery performance.

Multiple Super Ring (MSR) technology is *Korenix's* 3rd generation Ring redundancy technology. This is patented and protected by *Korenix* and is used in countries all over the world. MSR ranks the fastest restore and failover time in the world, 0 ms for restore and about milliseconds level for failover for 100Base-TX copper port. The other interface may take longer time due to the media characteristics.

Advanced **Rapid Dual Homing (RDH)** technology also facilitates *JetNet Managed Switch* to connect with a core managed switch easily and conveniently. With RDH technology, you can also couple several Rapid Super Rings or RSTP cloud together, which is also known as Auto Ring Coupling.

TrunkRing technology allows integrate MSR with LACP/Port Trunking. The LACP/Trunk aggregated ports is a virtual interface and it can work as the Ring port of the MSR.

MultiRing is an outstanding technology Korenix can support. Multiple rings can be aggregated within one switch by using different Ring ID. The maximum Ring number one switch can support is half of total port volume. For example, the JetNet 6528Gf is a 24 Fast Ethernet + 4 Gigabit port design, that means maximum 14 Rings (12 x 100M Rings and 2 Gigabit Rings) can be aggregated to one JetNet 6528Gf. The feature saves much effort when constructing complex network architecture.

To become backwards compatible with the Legacy Super Ring technology implemented in *JetNet 4008/4508* V1 series switches, *JetNet 4510/4518/5000 Series* also supports Super Ring Client mode. The Super Ring ports can pass through Super Ring control packets extremely well and works with Super Ring.

New Ring: To create a Rapid Super Ring. Just fill in the Ring ID which has range from 0 to 31. If the name field is left blank, the name of this ring will automatically naming with Ring ID.

New Ring

Ring Configuration

Ring Configuration

ID: Once a Ring is created, This appears and can not be changed.

Name: This field will show the name of the Ring. If it is not filled in when creating, it will be automatically named by the rule "RingID".

Version: The version of Ring can be changed here. There are two modes to choose: Rapid Super Ring and Super Chain, the Rapid Super Ring as default;

Device Priority: The switch with highest priority (highest value) will be automatically selected as Ring Master. Then one of the ring ports in this switch will become forwarding port and the other one will become blocking port. If all of the switches have the same priority, the switch with the biggest MAC address will be selected as Ring Master.

Ring Port1: In Rapid Super Ring environment, you should have 2 Ring Ports. No matter this switch is Ring Master or not, when configuring RSR, 2 ports should be selected to be Ring Ports. For Ring Master, one of the ring ports will become the forwarding port and the other one will become the blocking port.

Path Cost: Change the Path Cost of Ring Port1. If this switch is the Ring Master of a Ring, then it determines the blocking port. The Port with higher Path Cost in the two ring Port will become the blocking port, If the Path Cost is the same, the port with larger port number will become the blocking port.

Ring Port2: Assign another port for ring connection

Path Cost: Change the Path Cost of Ring Port2

Rapid Dual Homing: Rapid Dual Homing is an important feature of Korenix 3rd generation Ring redundancy technology. When you want to connect multiple RSR or form redundant topology with other vendors,RDH could allow you to have maximum 7 multiple links for redundancy without any problem.

RDH Ext. ID: Rapid Dual Homing Extension ID. The Extension ID and Ring ID cannot be

the same, when dual home to the same foreign network. The Extension ID range from 0 to 7. With the combination of Extension ID(0 to 7) and Ring ID(0 to 31), we can now support up to 256(8*32) different dual homing rings

In Dual Homing I released with JetNet 4000/4500 series, you have to configure additional port as Dual Homing port to two uplink switches. In Rapid Dual Homing, you don't need to configure specific port to connect to other protocol. The Rapid Dual Homing will smartly choose the fastest link for primary link and block all the other link to avoid loop. If the primary link failed, Rapid Dual Homing will automatically forward the secondary link for network redundant. Of course, if there are more connections, they will be standby links and recover one of then if both primary and secondary links are broken.

Ring status: To enable/disable the Ring. Please remember to enable the ring after you add it.

Super Chain Configuration

ID: The Ring Identifier referring to this Ring(Chain).

Role: Super Chain has two node role Border and Member. Border is the node which connect to foreign network. Member is the node except the Border node in the Super Chain.

Edge Port: Edge Port is one of ring ports of Border node. It is used to connect to foreign network.

MultiRing: The MultiRing technology is one of the pattern of the MSR technology, the technology allows you to aggregate multiple rings within one switch. Create multiple ring ID and assign different ring port 1 and port 2 to each ring, thus the switch can have multiple rings in one JetNet switch.

When implementing MultiRing, remember that the different rings can NOT use the same ring ID. The other settings are the same as above description. Technically, the maximum ring volume the MultiRing supported is up to 16 rings. Due to the port volume limitation, the maximum value is half of the port volume of a switch.

TrunkRing: The MultiRing technology is part of the MSR technology which combines the MSR with the port trunking technology. After multiple ports aggregated, this is so-call port trunking (Static or learnt by LACP protocol), the Trunk ID can be one of the port ID of the MSR technology. Configured the port trunking first then you can add the Trunk group as a Ring Port in managed switch.

4.4.8 Ring Info

This page shows the MSR information.

Multiple Super Ring Information

ID: Ring ID.

Version: which version of this ring, this field could be Rapid Super Ring or Super Chain

Role: This Switch is RM or nonRM

Status: If this field is Normal which means the redundancy is approved. If any one of the link in this Ring is broken, then the status will be Abnormal.

RM MAC: The MAC address of Ring Master of this Ring. It helps to find the redundant path.

Blocking Port: This field shows which is blocked port of RM.

Role Transition Count: This means how many times this switch has changed its Role from nonRM to RM or from RM to nonRM.

Ring state Transition Count: This number means how many times the Ring status has been transformed between Normal and Abnormal state.

4.4.9 ERPS Configuration:

Ethernet Ring Protection Switching, or ERPS, is an effort at ITU-T under G.8032 Recommendation to provide sub-50ms protection and recovery switching for Ethernet traffic in a ring topology and at the same time ensuring that there are no loops formed at the Ethernet layer.

Figure 4.4.9 Web UI of ERPS configuration

ERPS Configuration

Apply

ERPS: Enable or disable ERPS function.

ERPS Configuration:

Version: ERPS has version 1 and 2. Now we just support ERPSv1

Node State: The current state of the node, Idle and Protection.

Node Role: The role of the node, RPL owner and Ring node. The RPL owner is an

Ethernet ring node adjacent to the RPL.

Control Channel: Control Channel provide a communication channel for ring automatic protection switching (R-APS) information.

Ring Port: A ring link is bounded by two adjacent nodes and a port for a ring link is called a ring port.

RPL Port: The ring protection link (RPL) is the ring link which under normal conditions, i.e., without any failure or request, is blocked for traffic channel, to prevent the formation of loops.

4.5 VLAN

A Virtual LAN (VLAN) is a "logical" grouping of nodes for the purpose of limiting a broadcast domain to specific members of a group without physically grouping the members together. That means, VLAN allows you to isolate network traffic so that only members of VLAN could receive traffic from the same VLAN members. Basically, creating a VLAN from a switch is the logical equivalent of physically reconnecting a group of network devices to another Layer 2 switch, without actually disconnecting these devices from their original switches.

JetNet 6528Gf Series Industrial Ethernet Switch supports 802.1Q VLAN. 802.1Q VLAN is also known as Tag-Based VLAN. This Tag-Based VLAN allows VLAN to be created across different switches (see Figure 1). IEEE 802.1Q tag-based VLAN makes use of VLAN control information stored in a VLAN header attached to IEEE 802.3 packet frames. This tag contains a VLAN Identifier (VID) that indicates which VLAN a frame belongs to. Since each switch only has to check a frame's tag, without the need to dissect the contents of the frame, this also saves a lot of computing resources within the switch.

Figure 4.5.1 802.1Q VLAN

QinQ

The QinQ is originally designed to expand the number of VLANs by adding a tag to the 802.1Q packets. The original VLAN is usually identified as Customer VLAN (C-VLAN) and the new added t–g - as Service VLAN(S-VLAN). By adding the additional tag, QinQ increases the possible number of VLANs. After QinQ enabled, the JetNet can

reach up to 256x256 VLANs. With different standard tags, it also improves the network security.

VLAN Configuration group enables you to Add/Remove VLAN, configure QinQ, port Ingress/Egress parameters and view VLAN table.

VLAN Configuration group enables you to Add/Remove VLAN, configure port Ingress/Egress parameters and view VLAN table.

Following commands are included in this group:

- 4.5.1 VLAN Port Configuration
- 4.5.2 VLAN Configuration
- 4.5.3 GVRP Configuration
- 4.5.4 VLAN Table
- 4.5.5 CLI Commands of the VLAN

4.5.1 VLAN Port Configuration

VLAN Port Configuration allows you to set up VLAN port parameters to specific port. These parameters include PVID, Accept Frame Type and Ingress Filtering.

VLAN Port Configuration

VLAN Port Configuration

Port	PVID	Tunnel Mode	EtherType	Accept Frame Type	Ingress Filtering	
1	1	None	0x8100	Admit All	Disable	•
2	1	None	0x8100	Admit All	Disable	
3	2	None	0x8100	Admit All	Disable	
4	1	None	0x8100	Admit All	Disable	
5	1	None	0x8100	Admit All	Disable	
6	1	None	0x8100	Admit All	Disable	
7	1	None	0x8100	Admit All	Disable	
8	1	None	0x8100	Admit All	Disable	
9	2	None	0x8100	Admit All	Disable	
10	1	None	0x8100	Admit All	Disable	v
Apply						

Figure 4.5.2 Web UI of VLAN configuration.

PVID: The abbreviation of the **Port VLAN ID**. Enter port VLAN ID here. PVID allows the switches to identify which port belongs to which VLAN. To keep things simple, it is recommended that PVID is equivalent to VLAN IDs.

The values of PVIDs are from 0 to 4095. But, 0 and 4095 are reserved. You can't input these 2 PVIDs. 1 is the default value. 2 to 4094 are valid and available in this column. Type the PVID you'd like to configure here.

Tunnel Mode: This is the new command for QinQ. The command includes None, 802.1Q Tunnel and 802.1Q Tunnel Uplink. The figure shows the relationship between 802.1Q Tunnel and 802.1Q Tunnel Uplink.

Following is the modes you can select.

None: Remian VLAN setting, no QinQ.

802.1Q Tunnel: The QinQ command applied to the ports which connect to the C-VLAN. The port receives tagged frame from the C-VLAN. Add a new tag (Port VID) as S-VLAN VID. When the packets are forwarded to C-VLAN, the S-VLAN tag is removed.

After 802.1Q Tunnel mode is assigned to a port, the egress setting of the port should be "**Untag**", it indicates the egress packet is always untagged. This is configured in Static VLAN Configuration table. Please refer to the VLAN Configuration chapter in below.

802.1Q Tunnel Uplink: The QinQ command applied to the ports which connect to the S-VLAN. The port receives tagged frame from the S-VLAN. When the packets are forwarded to S-VLAN, the S-VLAN tag is kept.

After 802.1Q Tunnel Uplink mode is assigned to a port, the egress setting of the port should be "**Tag**", it indicates the egress packet is always tagged. This is configured in Static VLAN Configuration table. Please refer to the VLAN Configuration chapter in below.

For example, the VID of S-VLAN/Tunnel Uplink is 10, the VID of C-VLAN/Tunnel is 5. The 802.1Q Tunnel port receives tag 5 from C-VLAN, add tag 10 to the packet. When the packets are forwarded to S-VLAN, tag 10 is kept.

EtherType: This column allows you to define the EtherType manually. This is advanced QinQ parameter which allows to define the transmission packet type.

Accept Frame Type: This column defines the accepted frame type of the port. There are 2 modes you can select, **Admit All** and **Tag Only**. Admit All mode means that the port can accept both tagged and untagged packets. Tag Only mode means that the port can only accept tagged packets.

Ingress Filtering: Ingress filtering helps VLAN engine to filter out undesired traffic on a port. When Ingress Filtering is enabled, the port checks whether the incoming frames belong to the VLAN they claimed or not. Then the port determines if the frames can be processed or not. For example, if a tagged frame from Engineer VLAN is received, and Ingress Filtering is enabled, the switch will determine if the port is on the Engineer VLAN's Egress list. If it is, the frame can be processed. If it's not, the frame would be dropped.

4.5.2 VLAN Configuration

In this page, you can assign Management VLAN, create the static VLAN, and assign the Egress rule for the member ports of the VLAN.

Figure 4.5.2.1 Web UI of the VLAN Configuration.

Management VLAN ID: The switch supports management VLAN. The management VLAN ID is the VLAN ID of the CPU interface so that only member ports of the management VLAN can ping and access the switch. The default management VLAN ID is 1.

Static VLAN: You can assign a VLAN ID and VLAN Name for new VLAN here.

VLAN ID is used by the switch to identify different VLANs. Valid VLAN ID is between 1 and 4094. 1 is the default VLAN.

VLAN Name is a reference for network administrator to identify different VLANs. The available character is 12 for you to input. If you don't input VLAN name, the system will automatically assign VLAN name for the VLAN. The rule is VLAN (VLAN ID).

Static VLAN

Figure 4.5.2.2 The steps to create a new VLAN: Type VLAN ID and NAME, and press **Add** to create a new VLAN. Then you can see the new VLAN in the Static VLAN Configuration table. Refer to Figure 4.5.2.3

After created the VLAN, the status of the VLAN will remain in Unused until you add ports to the VLAN.

Note: Before you change the management VLAN ID by Web and Telnet, remember that the port attached by the administrator should be the member port of the management VLAN; otherwise the administrator can't access the switch via the network.

Note: Currently JetNet 6528Gf supports max 256 group VLAN.

Static VLAN Configuration

You can see the created VLANs and specify the egress (outgoing) port rule to be **Untagged or Tagged** here.

Figure 4.5.2.3 Static VLAN Configuration table. You can see that new VLAN 3 is created. VLAN name is test. Egress rules of the ports are not configured now.

Static VLAN Configuration

Figure 4.5.2.4 Configure Egress rule of the ports.

-- : Not available

U: Untag: Indicates that egress/outgoing frames are not VLAN tagged.

T: **Tag**: Indicates that egress/outgoing frames are to be VLAN tagged.

Steps to configure Egress rules: Select the VLAN ID. Entry of the selected VLAN turns to light blue. Assign Egress rule of the ports to **U** or **T**. Press **Apply** to apply the setting. If you want to remove one VLAN, select the VLAN entry. Then press **Remove** button.

4.5.3 GVRP configuration

GVRP allows users to set-up VLANs automatically rather than manual configuration on every port of every switch in the network. In low volume and stable network, the GVRP can reduce the configuration effort. For high volume and high secure request network, the Static VLAN configuration is always preferred.

GVRP Configuration

Port	State	Join Timer	Leave Timer	Leave All Timer
1	Disable	20	60	1000
2	Disable	20	60	1000
3	Disable	20	60	1000
4	Disable	20	60	1000
5	Disable	20	60	1000
6	Disable	20	60	1000
7	Disable	20	60	1000
8	Disable	20	60	1000
9	Disable	20	60	1000
10	Disable	20	60	1000

Note: Timer unit is centiseconds.

Apply

GVRP Protocol: Allow user to enable/disable GVRP globally.

State: After enable GVRP globally, here still can enable/disable GVRP by port.

Join Timer: Controls the interval of sending the GVRP Join BPDU. An instance of this timer is required on a per-Port, per-GARP Participant basis

Leave Timer: Control the time to release the GVRP reservation after received the GVRP Leave BPDU. An instance of the timer is required for each state machine that is in the LV state

Leave All Timer: Controls the period to initiate the garbage collection of registered VLAN. The timer is required on a per-Port, per-GARP Participant basis

4.5.4 VLAN Table

This table shows you current settings of your VLAN table, including VLAN ID, Name, Status, and Egress rule of the ports.

VLAN ID: ID of the VLAN. **Name:** Name of the VLAN.

Status: Static shows this is a manually configured static VLAN. **Unused** means this VLAN is created by UI/CLI and has no member ports. This VLAN is not workable yet. **Dynamic** means this VLAN is learnt by GVRP.

After created the VLAN, the status of this VLAN will remain in Unused status until you add ports to the VLAN.

4.6 Private VLAN

The private VLAN helps to resolve the primary VLAN ID shortage, client ports' isolation and network security issues. The Private VLAN provides primary and secondary VLAN within a single switch.

Primary VLAN: The uplink port is usually the primary VLAN. A primary VLAN contains promiscuous ports that can communicate with lower Secondary VLANs.

Secondary VLAN: The client ports are usually defined within secondary VLAN. The secondary VLAN includes Isolated VLAN and Community VLAN. The client ports can be isolated VLANs or can be grouped in the same Community VLAN. The ports within the same community VLAN can communicate with each other. However, the isolated VLAN ports can Not.

The figure shows the typical Private VLAN network. The SCADA/Public Server or NMS workstation is usually located in primary VLAN. The clients PCs or Rings are located within Secondary.

Private VLAN (PVLAN) Configuration group enables you to Configure PVLAN, PVLAN Port and see the PVLAN Information.

Following commands are included in this group:

- 4.6.1 PVLAN Configuration
- 4.6.2 PVLAN Port Configuration
- 4.6.3 PVLAN Informtion
- 4.6.4 CLI Commands of the PVLAN

4.6.1 PVLAN Configuration

PVLAN Configuration allows you to assign Private VLAN type. After created VLAN in VLAN Configuration page, the available VLAN ID will display here. Choose the Private VLAN types for each VLAN you want configure.

None: The VLAN is Not included in Private VLAN.

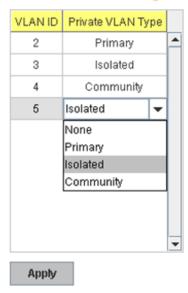

Primary: The VLAN is the Primary VLAN. The member ports can communicate with secondary ports.

Isolated: The VLAN is the Isolated VLAN. The member ports of the VLAN are isolated.

Community: The VLAN is the Community VLAN. The member ports of the VLAN can

Private VLAN Configuration

Private VLAN Configuration

communicate with each other.

4.6.2 PVLAN Port Configuration

PVLAN Port Configuration page allows configure Port Configuration and Private VLAN Association.

Private VLAN Association

Secondary VLAN: After the Isolated and Community VLAN Type is assigned in Private VLAN Configuration page, the VLANs are belonged to the Secondary VLAN and displayed here.

Primary VLAN: After the Primary VLAN Type is assigned in Private VLAN Configuration page, the secondary VLAN can associate to the Primary VLAN ID. Select the Primary VLAN ID here.

Note: Before configuring PVLAN port type, the Private VLAN Association should be done first.

Port Configuration

PVLAN Port Type:

Normal: The Normal port is None PVLAN ports, it remains its original VLAN setting.

Host: The Host type ports can be mapped to the Secondary VLAN.

Promiscuous: The promiscuous port can be associated to the Primary VLAN.

VLAN ID: After assigned the port type, the web UI display the available VLAN ID the port can associate to.

For example:

- 1. VLAN Create: VLAN 2-5 are created in VLAN Configuration page.
- **2. Private VLAN Type:** VLAN 2-5 has its Private VLAN Type configured in Private VLAN Configuration page.

VLAN 2 is belonged to Primary VLAN.

VLAN 3-5 are belonged to secondary VLAN (Isolated or Community).

3. Private VLAN Association: Associate VLAN 3-5 to VLAN 2 in Private VLAN Association first.

4. Private VLAN Port Configuration:

VLAN 2 - Primary -> The member port of VLAN 2 is promiscuous port.

VLAN 3 – Isolated -> The Host port can be mapped to VLAN 3.

VLAN 4 - Community -> The Host port can be mapped to VLAN 4.

VLAN 5 – Community -> The Host port can be mapped to VLAN 5.

5. Result:

VLAN 2 -> VLAN 3, 4, 5; member ports can communicate with ports in secondary VLAN.

VLAN 3 -> VLAN 2, member ports are isolated, but it can communicate with member port of VLAN 2..

VLAN 4 -> VLAN 2, member ports within the community can communicate with each other and communicate with member port of VLAN 2.

VLAN 5 -> VLAN 2, member ports within the community can communicate with each other and communicate with member port of VLAN 2.

4.7 Traffic Prioritization

Quality of Service (QoS) provides traffic prioritization mechanism which allows users to deliver better service to certain flows. QoS can also help to alleviate congestion problems and ensure high-priority traffic is delivered first. This section allows you to configure Traffic Prioritization settings for each port with regard to setting priorities.

JetNet QOS supports 8 physical queues, round robin (RR), weighted fair queuing (WRR) and Strict Priority scheme, which follows 802.1p COS tag and IPv4 TOS/DiffServ information to prioritize the traffic of your industrial network.

Following commands are included in this group:

- 4.7.1 QoS Setting
- 4.7.2 Port-based Queue Mapping
- 4.7.3 CoS-Queue Mapping
- 4.7.4 DSCP-Priority Mapping
- 4.7.5 CLI Commands of the Traffic Prioritization

4.7.1 QoS Setting

In QoS setting, you should choose the QoS Priority Mode first, Port-Based, Cos or DSCP modes. Choose the preferred mode and you can configure the next settings in its own

QoS Setting

QoS Trust Mode

- 802.1P priority tag
- DSCP/TOS code point

Queue Scheduling

- Use a Round Robin scheme
- Use a Strict Priority scheme
- Use Weighted Round Robin scheme

configuration pages. The other page of the mode you don't select can't be configured.

In QoS setting, you should choose the QoS Priority Mode first, Port-Based, Cos or DSCP modes. Choose the preferred mode and you can configure the next settings in its own configuration pages. The other page of the mode you don't select can't be configured.

Queue Scheduling

You can select the Queue Scheduling rule as follows:

Use a Round Robin scheme. The Round Robin scheme means all the priority has the same privilege, the traffic is forward cyclic from highest to lowest.

Use a strict priority scheme. Packets with higher priority in the queue will always be processed first, except that there is no packet with higher priority.

Use Weighted Round Robin scheme. This scheme allows users to assign new weight ratio for each class. The 10 is the highest ratio. The ratio of each class is as below:

Wx / W0 + W1 + W2 + W3 + W4 + W5 + W6 + W7 (Total volume of Queue 0-7)

4.7.2 Port-based Queue Mapping

Choose the Queue value of each port, the port then has its default priority. The Queue 3 is the highest port-based queue, 0 is the lowest queue. The traffic injected to the port follows the queue level to be forwarded, but the outgoing traffic doesn't bring the queue level to next switch.

After configuration, press **Apply** to enable the settings.

4.7.3 CoS-Queue Mapping

This page is to change CoS values to Physical Queue mapping table. Since the switch fabric of JetNet only supports 4 physical queues, Lowest, Low, Middle and High. Users should therefore assign how to map CoS value to the level of the physical queue.

In JetNet, users can freely assign the mapping table or follow the suggestion of the 802.1p standard. Korenix uses 802.p suggestion as default values. You can find CoS values 1 and 2 are mapped to physical Queue 0, the lowest queue. CoS values 0 and 3 are mapped to physical Queue 1, the low/normal physical queue. CoS values 4 and 5 are mapped to

physical Queue 2, the middle physical queue. CoS values 6 and 7 are mapped to physical Queue 3, the high physical queue.

CoS-Queue Mapping

After configuration, press **Apply** to enable the settings.

4.7.4 DSCP-Priority Mapping

This page is to change DSCP values to Priority mapping table. The system provides 0~63 DSCP priority level. Each level can map to one priority ID

DSCP-Priority Mapping

DSCP-Priority Mapping

Apply

After configuration, press **Apply** to enable the settings.

4.7.5 CLI Commands of the Traffic Prioritization

Command Lines of the Traffic Prioritization configuration

Feature	Command Line
QoS Setting	
Queue Scheduling – Strict Priority	Switch(config)# qos queue-sched rr Round Robin sp Strict Priority wrr Weighted Round Robin Switch(config)# qos queue-sched sp
Ougus Cabaduling	The queue scheduling scheme is setting to Strict Priority.
Queue Scheduling – Round Robin	Switch(config)# qos queue-sched rr The queue scheduling scheme is setting to Round Robin.
Queue Scheduli-g - WRR	Switch(config)# qos queue-sched wrr <1-10> Weights for COS queue 0 (queue_id 0) Switch(config)# qos queue-sched wrr 10 <1-10> Weights for COS queue 1 (queue_id 1) Switch(config)# qos queue-sched wrr 1 2 3 4 5 6 7 8 The queue scheduling scheme is setting to Weighted Round Robin.
	Assign the votic for the Colones of convice
Port Setting – CoS	Assign the ratio for the 8 classes of service. Switch(config)# interface gi1
(Default Port Priority)	Switch(config-if)# qos priority <0-7> Assign a priority queue Switch(config-if)# qos priority 3 The priority queue is set 3 ok.
	Note: When change the port setting, you should Select the

4.8 Multicast Filtering

For multicast filtering, *JetNet 6528Gf* uses IGMP Snooping technology. IGMP (Internet Group Management Protocol) is an Internet Protocol that provides a way for internet device to report its multicast group membership to adjacent routers. Multicasting allows one computer on the internet to send data to a multitude of other computers that have identified themselves as being interested in receiving the originating computers data.

Multicasting is useful for such applications as updating the address books of mobile computer users in the field, sending out newsletters to a distribution list, and broadcasting streaming media to an audience that has tuned into the event by setting up multicast group membership.

In effect, IGMP Snooping manages multicast traffic by making use of switches, routers, and hosts that support IGMP. Enabling IGMP Snooping allows the ports to detect IGMP queries, report packets, and manage multicast traffic through the switch. IGMP has three fundamental types of messages, as shown below:

Message	Description
Query	A message sent from the querier (an IGMP router or a switch) which asks for a response from each host that belongs to the multicast group.
Report	A message sent by a host to the querier to indicate that the host wants to be or is a member of a given group indicated in the report message.
Leave Group	A message sent by a host to the querier to indicate that the host has quit as a member of a specific multicast group.

You can enable **IGMP Snooping** and **IGMP Query** functions here. You will see the information of the IGMP Snooping function in this section, including different multicast groups' VID and member ports, and IP multicast addresses that range from 224.0.0.0 to 239.255.255.

In this section, Force filtering can determined whether the switch flooding unknown multicast or not.

Following commands are included in this group:

- 4.8.1 IGMP Snooping
- 4.8.2 IGMP Query
- 4.8.3 Unknown Multicast
- 4.8.4 GMRP Configuration
- 4.8.5 CLI Commands of the Multicast Filtering

4.8.1 IGMP Snooping

This page is to enable IGMP Snooping feature, assign IGMP Snooping for specific VLAN, and view IGMP Snooping table from dynamic learnt or static manual key-in. *JetNet6528Gf* support IGMP snooping V1/V2/V3 automatically and IGMP query V1/V2.

IGMP Snooping, you can select **Enable** or **Disable** here. After enabling IGMP Snooping, you can then enable IGMP Snooping for specific VLAN. You can enable IGMP Snooping for some VLANs so that some of the VLANs will support IGMP Snooping and others won't.

To assign IGMP Snooping to VLAN, please select VLAN ID to enable/disable IGMP

Snooping function, or select the "IGMP Snooping" global setting for all VLANs. Then press **Apply**. In the same way, you can also **Disable** IGMP Snooping for certain VLANs.

Filtering Mode Setting: you can select Filtering Mode on this Page.

Send to Query Ports: The unknown multicast will be sent to the Query ports. The Query port means the port received the IGMP Query packets. It is usually the uplink port of the switch.

Send to All Ports: The unknown multicast will be flooded to all ports of the same VLAN, even they are not the IGMP member ports of the groups.

Discard: The unknown multicast will be discarded. Non-member ports will not receive the unknown multicast streams.

This page allows you to decide how to forward the unknown multicast traffic.

IGMP Snooping Table: In the table, you can see multicast group IP address, VLAN ID it belongs to, and member ports of the multicast group. *JetNet 6528Gf* supports 256 multicast groups. Click on **Reload** to refresh the table.

4.8.2 IGMP Query

IGMP Query

Version	Version 1	
Query Interval(s)	125	
Query Maximum Response Time(s)	0	

This page allows users to configure **IGMP Query** feature. Since *JetNet 6528Gf* can only be configured by member ports of the management VLAN, IGMP Query can only be enabled on the management VLAN. If you want to run IGMP Snooping feature in several VLANs, you should notice that whether each VLAN has its own IGMP Querier first.

The IGMP querier periodically sends query packets to all end-stations on the LANs or VLANs that are connected to it. For networks with more than one IGMP querier, a switch with the lowest IP address becomes the IGMP querier.

In IGMP Query selection, you can select V1, V2 or Disable. V1 means IGMP V1 General Query and V2 means IGMP V2 General Query.. The query will be forwarded to all multicast groups in the VLAN. **Disable** allows you to disable IGMP Query.

Query Interval(s): The period of query sent by querier.

Query Maximum Response Time: The span querier detect to confirm there are no more directly connected group members on a LAN.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

4.8.3 Unknown Multicast

After enabled IGMP Snooping, the known multicast can be filtered by IGMP Snooping mechanism and forwarded to the member ports of the known multicast groups. The other multicast streams which are not leant is so-called unknown multicast, the switch decide how to forward them based on the setting of this page.

Send to All Ports: The unknown multicast will be flooded to all ports of the same VLAN, even they are not the IGMP member ports of the groups.

Discard: The unknown multicast will be discarded. Non-member ports will not receive the unknown multicast streams.

This page allows you to decide how to forward the unknown multicast traffic.

Unknown Multicast

Once you finish configuring the settings, click on **Apply** to apply your configuration.

4.8.4 GMRP Configuration

To enable the GMRP configuration, the Global GMRP Configuration should be enabled first. And all the port interfaces should enable GMRP learning as well. Then the switch exchange the IGMP Table with other switches which is also GMRP-aware devices.

GMRP Configuration

4.9 SNMP

Simple Network Management Protocol (SNMP) is a protocol used for exchanging management information between network devices. SNMP is a member of the TCP/IP protocol suite. *JetNet 6528Gf* series support SNMP v1 and v2c and V3.

An SNMP managed network consists of two main components: agents and a manager. An agent is a management software module that resides in a managed switch. An agent translates the local management information from the managed device into a SNMP compatible format. The manager is the console through the network.

Following commands are included in this group:

- 4.9.1 SNMP Configuration
- 4.9.2 SNMP V3 Profile
- 4.9.3 SNMP Traps
- 4.9.4 SNMP CLI Commands for SNMP

4.9.1 SNMP Configuration

This page allows users to configure SNMP V1/V2c Community. The community string can be viewed as the password because SNMP V1/V2c doesn't request you to enter password before you try to access SNMP agent.

The community includes 2 privileges, Read Only and Read and Write.

With **Read Only** privilege, you only have the ability to read the values of MIB tables. Default community string is Public.

With **Read and Write** privilege, you have the ability to read and set the values of MIB tables. Default community string is Private.

JetNet 6528Gf allows users to assign 4 community strings. Type the community string and select the privilege. Then press **Apply**.

Note: When you first install the device in your network, we highly recommend you to change the community string. Since most SNMP management application uses Public and Private as their default community name, this might be the leakage of the network security.

SNMP

SNMP V1/V2c Community

4.9.2 SNMP V3 Profile

SNMP v3 can provide more security functions when the user performs remote management through SNMP protocol. It delivers SNMP information to the administrator with user authentication; all of data between *JetNet 6528Gf* and the administrator are encrypted to ensure secure communication.

SNMP V3 Profile

SNMP V3

User Name	
Security Level	Authentication
Authentication Portocol	SHA ▼
Authentication Password	
DES Encryption Password	
Add	

Security Level: Here the user can select the following levels of security: None, User Authentication, and Authentication with privacy.

Authentication Protocol: Here the user can select either MD5 (Message-Digest algorithm 5) or SHA (Secure Hash Algorithm). MD5 is a widely used cryptographic hash function with a 128-bit hash value. SHA (Secure Hash Algorithm) hash functions refer to five Federal Information Processing Standard-approved algorithms for computing a condensed digital representation. *JetNet 6528Gf* provides 2 user authentication protocols in MD5 and SHA. You will need to configure SNMP v3 parameters for your SNMP tool with the same authentication method.

Authentication Password: Here the user enters the SNMP v3 user authentication password.

DES Encryption Password: Here the user enters the password for SNMP v3 user DES

Encryption.

4.9.3 SNMP Traps

SNMP Trap is the notification feature defined by SNMP protocol. All the SNMP management applications can understand such trap information. So you don't need to install new application to read the notification information.

This page allows users to **Enable SNMP Trap**, configure the **SNMP Trap server IP**, **Community** name, and trap **Version V1 or V2**. After configuration, you can see the change of the SNMP pre-defined standard traps and Korenix pre-defined traps. The pre-defined traps can be found in Korenix private MIB.

SNMP Trap

Trap Server Profile

4.9.4 CLI Commands of the SNMP

Command Lines of the SNMP configuration

Feature	Command Line
SNMP Community

4.10 Security

JetNet 6528Gf provides several security features for you to secure your connection. The Filter Set is also known as Access Control List. The ACL feature includes traditional Port Security and IP Security.

Following commands are included in this group:

- 4.10.1 Filter Set (Access Control List)
- 4.10.2 IEEE 802.1x
- 4.10.3 CLI Commands of the Security

4.10.1 Filter Set (Access Control List)

The Filter Set is known as Access Control List feature. There are 2 major types, one is MAC Filter, it is also known as Port Security in other JetNet series. It allows user to define the access rule based on the MAC address flexibility. Another one is IP Filter. It includes the IP security known in other JetNet series, IP Standard access list and advanced IP based access lists.

ACE is short of Access Control Entry, user defines the Permit or Deny rule for specific IP/MAC address or IP groups by network mask in each ACE. One ACL may include several ACEs, the system checks the ACEs one after one and forward based on the result. Once the rules conflict, the old entry is selected as the forward rule.

Type the **Name** when select **MAC Filter**, type **ID/Name** when select **IP Filter**. The ID for IP access list is listed as below of the field. Click **Add** to add the rule. Click **Edit** to edit the content for the rule. After configured, click **Apply** to apply all the rules. **Reload** to reload setting. **Remove** to remove one of the entries.

Filter Set

MAC Filter (Port Security):

The MAC Filter allows user to define the Access Control List for specific MAC address or a group of MAC addresses.

Filter Rule

Filter ID/Name: The name for this MAC Filter entry.

Action: Permit to permit traffic from specified sources. **Deny** to deny traffic from those sources.

Source/Destination Address: Type the MAC address you want configure, the format is "AABB.CCDD.EEFF". Example: "Source to Destination" is "0012.7700.0000 to 0012.7700.0002".

Source/Destination Wildcard: This command allows user to define single host or a group of hosts based on the wildcard. Some of the allowance examples are as below:

Wildcard	Bit	Number of allowance	Note
Any	1111.1111.1111	All	
Host		1	Only the Source or Destination.
0000.0000.0003	0000.0000.000(00000011)	3	
0000.0000.0007	0000.0000.000(00000111)	7	
0000.0000.000F	0000.0000.000(11111111)	15	

Egress Port: Bind the MAC Filter rule to specific front port.

Once you finish configuring the ACE settings, click on **Add** to apply your configuration. You can see below screen is shown.

Example of the below Entry:

Permit Source MAC "0012.7700.0000" to Destination MAC "0012.7700.0002". The Permit rule is egress rule and it is bind to Gigabit Ethernet Port 25.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

IP Filter:

Type **ID/Name** when select **IP Filter**. The ID for IP access list is listed as below of the field. You can also type ACL name in this field, it goes to IP Extended mode setting and support both IP Standard and IP Extended mode depend on the setting. Click **Add** to add the rule. Click **Edit** to edit the content for the rule. After configured, click **Apply** to apply all the rules. **Reload** to reload setting. **Remove** to remove one of the entries.

Example:

Filter Set

IP Standard Access List: This kind of ACL allows user to define filter rules according to the source IP address.

IP Extended Access List: This kind of ACL allows user to define filter rules according to the source IP address, destination IP address, Source TCP/UDP port, destination TCP/UDP port and ICMP type and code.

Click Edit to configure the IP Filter Rules.

Filter Rule

Filter ID/Name: The ID or the name for this IP Filter entry.

Action: Permit to permit traffic from specified sources. **Deny** to deny traffic from those sources.

Source/Destination Address: Type the source/destination IP address you want configure.

Source/Destination Wildcard: This command allows user to define single host or a group of hosts based on the wildcard. Some of the allowance examples are as below:

Source Address:	192.168.10.2
Source Wildcard:	Host ▼
Protocol:	Any
	<mark></mark> Host ≡
Source Port:	0.0.0.1
Source Port Wildcard:	0.0.0.3
	0.0.0.7
ICMP Type:	0.0.0.15
Egress Port:	0.0.0.31
	0.0.0.63

Wildcard	Bit	Number of allowance	Note
Any	11111111.11111111.	All	All IP addresses. Or a mask: 255.255.255.255
Host	0.0.0.0	1	Only the Source or Destination host.
0.0.0.3	0.0.0.(00000011)	3	
0.0.0.7	0.0.0.(00000111)	7	
0.0.0.15	0.0.0.(11111111)	15	

Note: The mask is a wildcard mask: the high-order bits of the mask that are binary zeros determine how many corresponding high-order bits in the IP address are significant. The selected action applies to any source address with these high-order bits.

Protocol: Select a protocol you want associate with the filter. The field includes IP, TCP, UDP or ICMP type.

Destination Port: TCP/UDP port of the Destination Port field.

ICMP Type: The ICMP Protocol Type range from 1 ~ 255. **ICMP Code:** The ICMP Protocol Code range from 1 ~ 255.

Egress Port: Bind this Filter to selected egress port.

Click the **Add** button to add the rule to the Filter. Click the **Remove** button to remove the selected rule from Filter. Click the **Modify** button to edit the rule which you selected. Click the **Reload** button to reload the rule table.

Click the **Apply** button to apply the Filter configurations.

Filter Attach

After configured the ACL filter rules, remember associate this filter with the physical ports. Then the port has the capability to filter traffic/attach based on the packets lost.

4.10.2 IEEE 802.1x

4.10.3.1 802.1X configuration

IEEE 802.1X is the protocol that performing authentication to obtain access to IEEE 802 LANs. It is port-base network access control. With the function, JetNet 6528Gf could control which connection is available or not.

802.1x Port-Based Network Access Control Configuration

System Auth Co	ontrol Disable -	•		
Authentication N	Method RADIUS ▼	•		
Apply				
RADIUS Server		Local RADIUS	User	
RADIUS Server IP	192.168.10.100	Username	Password	VID
Shared Key	radius-key			
Server Port	1812	Add		
Accounting Port	1813	Add		
Secondary RAD	IUS Server	Local RADIUS	User List	
Secondary RAD	IUS Server	Local RADIUS Username	User List Password	VID
	OIUS Server			VID
RADIUS Server IP	IUS Server			
RADIUS Server IP Shared Key	IUS Server			
RADIUS Server IP Shared Key Server Port Accounting Port	OIUS Server			
RADIUS Server IP Shared Key Server Port	OIUS Server			

System AuthControl: To enable or disable the 802.1x authentication.

Authentication Method: Radius is a authentication server that provide key for authentication, with this method, user must connect switch to server. If user select Local for the authentication method, switch use the local user data base which can be create in this page for authentication.

Radius Server IP: The IP address of Radius server

Shared Key: The password for communicate between switch and Radius Server.

Server Port: UDP port of Radius server.

Accounting Port: Port for packets that contain the information of account login or logout.

Secondary Radius Server IP: Secondary Radius Server could be set in case of the primary radius server down.

Local Radius User: Here User can add Account/Password for local authentication.

Local Radius User List: This is a list shows the account information, User also can remove selected account Here.

4.10.3.2 802.1x Port Configuration

After the configuration of Radius Server or Local user list, user also need configure the authentication mode, authentication behavior, applied VLAN for each port and permitted communication. The following information will explain the port configuration.

802.1x Port-Based Network Access Control Port Configuration

802.1x Port Configuration

Port	Port Control	Reauthentication	Max Request	Guest VLAN	Host Mode	Admin Control Direction	
1	Force Authorized	Disable	2	0	Single	Both	4
2	Force Authorized	Disable	2	0	Single	Both	
3	Force Authorized	Disable	2	0	Single	Both	
4	Force Authorized	Disable	2	0	Single	Both	
5	Force Authorized	Disable	2	0	Single	Both	
6	Force Authorized	Disable	2	0	Single	Both	-

802.1x Timeout Configuration

Port	Re-Auth Period(s)	Quiet Period(s)	Tx Period(s)	Supplicant Timeout(s)	Server Timeout(s)	
1	3600	60	30	30	30	92
2	3600	60	30	30	30	-
3	3600	60	30	30	30	
4	3600	60	30	30	30	
5	3600	60	30	30	30	
6	3600	60	30	30	30	

Apply

Once you finish configuring the settings, click on **Apply** to apply your configuration.

Port control: Force Authorized means this port is authorized; the data is free to in/out. Force unauthorized just opposite, the port is blocked. If users want to control this port with Radius Server, please select Auto for port control.

Reauthentication: If enable this field, switch will ask client to re-authenticate. The default time interval is 3600 seconds.

Max Request: the maximum times that the switch allow client request.

Guest VLAN: 0 to 4094 is available for this field. If this field is set to 0, that means the port is blocked after authentication fail. Otherwise, the port will be set to Guest VLAN.

Host Mode: if there are more than one device connected to this port, set the Host Mode to single means only the first PC authenticate success can access this port. If this port is set to multi, all the device can access this port once any one of them pass the authentication.

Control Direction: determined devices can end data out only or both send and receive.

Re-Auth Period: control the Re-authentication time interval, 1~65535 is available.

Quiet Period: When authentication failed, Switch will wait for a period and try to communicate with radius server again.

Tx period: the time interval of authentication request.

Supplicant Timeout: the timeout for the client authenticating

Sever Timeout: The timeout for server response for authenticating.

Click Initialize Selected to set the authorize state of selected port to initialize status.

Click **Reauthenticate Selected** to send EAP Request to supplicant to request re-authentication.

Click **Default Selected** to reset the configurable 802.1x parameters of selected port to the default values.

802.1X Port Status

Here user can observe the port status for Port control status, Authorize Status, Authorized Supplicant and Oper Control Direction each port.

802.1x Port-Based Network Access Control Port Status

Port	Port Control	Authorize Status	Authorized Supplicant	Oper Control Direction
1	Force Authorized	AUTHORIZED	NONE	Both
2	Force Authorized	AUTHORIZED	NONE	Both
3	Force Authorized	AUTHORIZED	NONE	Both
4	Force Authorized	AUTHORIZED	NONE	Both
5	Force Authorized	AUTHORIZED	NONE	Both
6	Force Authorized	AUTHORIZED	NONE	Both
7	Force Authorized	AUTHORIZED	NONE	Both
8	Force Authorized	AUTHORIZED	NONE	Both
9	Force Authorized	AUTHORIZED	NONE	Both
10	Force Authorized	AUTHORIZED	NONE	Both

4.11 Warning

JetNet 6528Gf provides several types of Warning features for you to remote monitor the status of end devices or the change of your network. The features include System Log and SMTP E-mail Alert.

Following commands are included in this group:

- 4.11.1 Fault Relay
- 4.11.2 Event Selection
- 4.11.3 Syslog Configuration
- 4.11.4 SMTP Configuration
- 4.11.5 CLI Commands

4.11.1 Fault Relay

The Switch provides 1 digital output, also known as Relay Output or Fault Relay. The relay contacts are energized (open) for normal operation and will close when fault event occurred. The fault event types includes Power, Port Link down, Ring failure, specified IP address ping failure, DI State change or perform a period of on/off. Each Fault Relay could be trigger by several of events, not only one.

Fault Relay

Dry Output:

On Period (Sec): Type the period time to turn on Relay Output. Available range of a period is 0-4294967295 seconds.

Off Period (Sec): Type the period time to turn off Relay Output. Available range of a period is 0-4294967295 seconds.

Ping Failure:

IP Address: IP address of the target device you want to ping.

Reset Time (Sec): Waiting time to short the relay output.

Hold Time (Sec): Waiting time to ping the target device for the duration of remote device boot

How to configure: After selecting Ping Failure event type, the system will turn Relay Output

to short state and continuously ping the target device. When the ping failure occurred, the switch will turn the Relay Output to open state for a period of Reset Time.

After the Reset Time timeout, the system will turn the Relay Output to close state. After the Hold Time timer is timeout, the switch system will start ping the target device.

Ex: Reset Time is 5 sec, Hold Time is 50 sec.

If the ping failure occurred, the switch system will turn Relay output to open state to emulate power switch off for 5 sec periods. After Reset Time timeout, the Switch system will start ping target device after 50 sec periods. The period time is for target device system booting. During the period, the switch system will not ping target device until Hold Time is timeout.

Ring:

Select Ring Failure. When the Ring topology is changed, the system will short Relay Out and lengthen DO LED.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

4.11.2 Event Selection

Event Types can be divided into two basic groups: System Events and Port Events. System Events are related to the overall function of the switch, whereas Port Events related to the activity of a specific ports

Warning - Event Selection

System Event Selection Device Cold Start Device Warm Start Authentication Failure Time Synchronize Failure Ring Event Relay1 SFP Power Failure AC1 AC2 Port Event Selection Port Link State

System Event	Warning Event is sent when
Device Cold Start	Power is cut off and then reconnected.
Device Warm Start	Reboot the device by CLI or Web UI.
Authentication failure	An incorrect password, SNMP Community String is
	entered.
Time Synchronize	Accessing to NTP Server is failure.
Failure	
Ring	If ring topology changed
Ping Reset	Ping target device and trigger relay to emulate power
	reset for remote device, if remote system crash. Note:
	once perform Ping reset, the relay output will form a
	short circuit.
Dry Output	Relay continuous perform On/Off behavior with
	different duration.
Power Failure	Power Failure when AC/DC power error.
Port Event	Warning Event is sent when
Link-Up	The port is connected to another device
Link-Down	The port is disconnected (e.g. the cable is pulled out,
	or the opposing devices turns down)

Once you finish configuring the settings, click on **Apply** to apply your configuration.

4.11.3 SysLog Configuration

System Log is useful to provide system administrator locally or remotely monitor switch events history. There are 2 System Log modes provided by *JetNet 6528Gf*, local mode and remote mode.

Local Mode: In this mode, *JetNet 6528Gf* will print the occurred events selected in the Event Selection page to System Log table of *JetNet 6528Gf*. You can monitor the system logs in [Monitor and Diag] / [Event Log] page.

Remote Mode: The remote mode is also known as Server mode in *JetNet 4500* series. In this mode, you should assign the IP address of the System Log server. *JetNet 6528Gf* will send the occurred events selected in Event Selection page to System Log server you assigned.

Both: Above 2 modes can be enabled at the same time.

Warning - SysLog Configuration

Once you finish configuring the settings, click on **Apply** to apply your configuration.

Note: When enabling Local or Both mode, you can monitor the system logs in [Monitor and Diag] / [Event Log] page.

4.11.4 SMTP Configuration

JetNet 6528Gf supports E-mail Warning feature. The switch will send the occurred events to remote E-mail server. The receiver can then receive notification by E-mail. The E-mail warning is conformed to SMTP standard.

This page allows you to enable E-mail Alert, assign the SMTP Server IP, Sender E-mail, and Receiver E-mail. If SMTP server requests you to authorize first, you can also set up the username and password in this page.

Warning - SMTP Configuration

Field	Description
SMTP Server IP Address	Enter the IP address of the email Server
Authentication	Click on check box to enable password

User Name	Enter email Account name (Max.40 characters)
Password	Enter the password of the email account
Confirm Password	Re-type the password of the email account
You can set up to 4 email add	resses to receive email alarm from JetNet
Rcpt E-mail Address 1	The first email address to receive email alert from
	JetNet (Max. 40 characters)
Rcpt E-mail Address 2	The second email address to receive email alert from
	JetNet (Max. 40 characters)
Rcpt E-mail Address 3	The third email address to receive email alert from
	JetNet (Max. 40 characters)
Rcpt E-mail Address 4	The fourth email address to receive email alert from
	JetNet (Max. 40 characters)

Once you finish configuring the settings, click on **Apply** to apply your configuration.

4.11.5 CLI Commands

4.12 Monitor and Diagnostic

JetNet 6528Gf provides several types of features for you to monitor the status of the switch or diagnostic for you to check the problem when encountering problems related to the switch. The features include MAC Address Table, Port Statistics, Port Mirror, Event Log and Ping.

Following commands are included in this group:

- 4.12.1 MAC Address Table
- 4.12.2 Port Statistics
- 4.12.3 Port Mirroring
- 4.12.4 Event Log
- 4.12.5 Topology Discovery (LLDP)
- 4.12.6 Ping
- 4.12.7 Modbus/TCP
- 4.12.8 EtherNet/IP
- 4.12.9 CLI Commands of the Monitor and Diag

4.12.1 MAC Address Table

JetNet 6528Gf provides 16K entries in MAC Address Table. In this page, users can change the Aging time, add Static Unicast MAC Address, monitor the MAC address or sort them by different packet types and ports. Click on **Apply** to change the value.

Aging Time (Sec)

Each switch fabric has limit size to write the learnt MAC address. To save more entries for new MAC address, the switch fabric will age out non-used MAC address entry per Aging Time timeout. The default Aging Time is 300 seconds. The Aging Time can be modified in this page.

Static Unicast MAC Address

In some applications, users may need to type in the static Unicast MAC address to its MAC address table. In this page, you can type MAC Address (format: xxxx.xxxx.xxxx), select its VID and Port ID, and then click on **Add** to add it to MAC Address table.

MAC Address Table

In this MAC Address Table, you can see all the MAC Addresses learnt by the switch fabric. The packet types include Management Unicast, Static Unicast, Dynamic Unicast, Static Multicast and Dynamic Multicast. The table allows users to sort the address by the packet types and port.

Packet Types: Management Unicast means MAC address of the switch. It belongs to CPU port only. Static Unicast MAC address can be added and deleted. Dynamic Unicast MAC is MAC address learnt by the switch Fabric. Static Multicast can be added by CLI and can be deleted by Web and CLI. Dynamic Multicast will appear after you enabled IGMP and the switch learnt IGMP report.

Click on **Remove** to remove the static Unicast/Multicast MAC address. Click on **Reload** to refresh the table. New learnt Unicast/Multicast MAC address will be updated to MAC address table.

4.12.2 Port Statistics

In this page, you can view operation statistics for each port. The statistics that can be viewed include Link Type, Link State, Rx Good, Rx Bad, Rx Abort, Tx Good, Tx Bad and Collision. Rx means the received packet while Tx means the transmitted packets.

Note: If you see many Bad, Abort or Collision counts increased, that may mean your network cable is not connected well, the network performance of the port is poor...etc. Please check your network cable, Network Interface Card of the connected device, the network application, or reallocate the network traffic...etc.

Click on **Clear Selected** to reinitialize the counts of the selected ports, and **Clear All** to reinitialize the counts of all ports. Click on **Reload** to refresh the counts.

Port Statistics

Port	Туре	Link	State	Rx Good	Rx Bad	Rx Abort	Tx Good	Tx Bad	Collision	
1	1000BASE	Down	Enable	0	0	0	0	0	0	•
2	1000BASE	Down	Enable	0	0	0	0	0	0	
3	1000BASE	Down	Enable	0	0	0	0	0	0	
4	1000BASE	Down	Enable	0	0	0	0	0	0	Ш
5	1000BASE	Down	Enable	0	0	0	0	0	0	
6	1000BASE	Down	Enable	0	0	0	0	0	0	
7	1000BASE	Up	Enable	395	0	2	1139	0	0	
8	1000BASE	Down	Enable	0	0	0	0	0	0	
9	1000BASE	Down	Enable	0	0	0	0	0	0	
10	1000BASE	Down	Enable	0	0	0	0	0	0	-
Clea	ar Selected	Clear	All	Reload						

4.12.3 Port Mirroring

Port mirroring (also called port spanning) is a tool that allows you to mirror the traffic from one or more ports onto another port, without disrupting the flow of traffic on the original port. Any traffic that goes into or out of the Source Port(s) will be duplicated at the Destination Port. This traffic can then be analyzed at the Destination port using a monitoring device or application. A network administrator will typically utilize this tool for diagnostics, debugging, or fending off attacks.

Port Mirror Mode: Select Enable/Disable to enable/disable Port Mirror.

Source Port: This is also known as Monitor Port. These are the ports you want to monitor. The traffic of all source/monitor ports will be copied to destination/analysis ports. You can choose single port or any combination of ports, you can monitor them in Rx only, TX only or both RX and TX. Click on checkbox of the RX, Tx to select the source ports.

Destination Port: This is also known as Analysis Port. You can analyze the traffic of all the monitored ports at this port without affecting the flow of traffic on the port(s) being monitored. Only one of the destination ports can be selected. A network administrator would typically connect a LAN analyzer or Netxray device to this port.

Port Mirroring

Once you finish configuring the settings, click on **Apply** to apply the settings.

4.12.4 Event Log

In the 4.10.3, we have introduced System Log feature. When System Log Local mode is selected, *JetNet 6528Gf* will record occurred events in local log table. This page shows this log table. The entry includes the index, occurred data and time and content of the events.

Click on Clear to clear the entries. Click on Reload to refresh the table.

System Event Logs

4.12.5 Topology Discovery (LLDP)

The JetNet 6528Gf supports 802.1AB Link Layer Discovery Protocol, thus the JetNet 6528Gf can be discovered by the Network Management System which support LLDP

discovery. With LLDP supported, the NMS can easier maintain the topology map, display port ID, port description, system description, VLAN ID... Once the link failure, the topology change events can be updated to the NMS as well. The LLDP Port State can display the neighbor ID and IP leant from the connected devices.

LLDP: Enable/Disable the LLDP topology discovery information.

LLDP Configuration: To configure the related timer of LLDP.

LLDP timer: The LLDPDP interval, the LLDP information is send per LLDP timer. The default value is 30 seconds.

LLDP hold time: The TTL (Time To Live) timer. The LLDP state will be expired once the LLDPDP is not received by the hold time. The default is 120 seconds.

LLDP Port State: Display the neighbor information learnt from the connected interface.

4.12.6 Ping Utility

This page provides **Ping Utility** for users to ping remote device and check whether the device is alive or not. Type **Target IP** address of the target device and click on **Start** to start the ping. After few seconds, you can see the result in the **Result** field.

4.12.7 Modbus/TCP

The Modbus is the most popular industrial protocol being used today. Modbus is a "master-slave" architecture, where the "master" sends polling request with address and data it wants to one of multiple "slaves". The slave device that is addressed responds to master. The master is often a PC, PLC, DCS or RTU... The salves are often the field devices. Some of them are "hybrid".

There are three most common Modbus versions, Modbus ASCII, Modbus RTU and Modbus/TCP. Ethernet based device, Industrial Ethernet Switch for example, supports Modbus/TCP that it can be polled through Ethernet. Thus the Modbus/TCP master can read or write the Modbus registers provided by the Industrial Ethernet Switch.

Korenix *JetNet 6528Gf* implements the Modbus/TCP registers into the latest firmware. The registers include the System information, firmware information, IP address, interfaces' status, port information, SFP information, inbound/outbound packet information.

With the supported registers, users can read the information through their own Modbus/TCP based progress/ display/ monitor applications and monitor the status of the switch easily.

There is no Web UI for Modbus/TCP configuration. The Modbus/TCP configuration can be changed through CLI.

Modbus/TCP Register Table

4.12.8 EtherNet/IP

EtherNet/IP is one of an industrial protocol that provides some device information and accessed by Ethernet. *JetNet 6528Gf* provides both standard class and private class such as KorenixRing information.

Note: Data format for the EIP Encapsulation Protocol is Little-Endian.

Example 1: Identity Class (0x01) Attribute 3 Product Code (2 bytes)

Register Value: 0x0401 (JetNet6059G)

Low Byte = 0x01High Byte = 0x04

Example 2:

Korenix Class (0x99) Attribute 5 Duplex (2 bytes)

Register Value: 0x0004 (Auto Full Duplex)

Low Byte = 0x04HighByte = 0x00

Following table lists the EtherNet/IP class supported by JetNet 6528Gf.

Identity Class(0x01)					
Attribute	Name	Format Description			
1	Vendor ID	2 bytes	Korenix Vendor ID: 1023 (0x03ff)		
2	Device Type	2 bytes	0x0 (Generic Device)		
3	Product Code	2 bytes	0x0000 UNKNOWN DEVICE

SFP Information (attribute 6)			
SFP Type	2 bytes	SFP Type	
Wave length	2 bytes	Wave length	
Distance	4 bytes	Distance	
Vender	16 bytes	Vender	
SFP DDM Information (attribute7)			
Temperature	2 bytes	Temperature	
		(Raw data)	
Alarm Temperature	4 bytes	Alarm Temperature	
		B[2]-B[3] : Raw data of High Alarm	
		B[0]-B[1]: Raw data of Low Alarm	
TX Power	2 bytes	Tx power	
		(Raw data)	
RX Power	2 bytes	Rx power	
		(Raw data)	
Warning TX Power	4 bytes	Warning Tx power	
		B[2]-B[3] : Raw data of High Alarm	
		B[0]-B[1]: Raw data of Low Alarm	
Warning RX Power	4 bytes	Warning Rx power	
		B[2]-B[3]: Raw data of High Alarm	
		B[0]-B[1]: Raw data of Low Alarm	

Korenix Ring Class(0x9a)			
Network Redundancy Information (attribute 1)			
Name	Format	Description	
Ring Name	String	Ring Name	
Status	2 bytes	Ring Status	
		0x0000: Normal	
		0x0001: Abnormal	
		0x0002: Occupied	
		0x0003: Unknown	
Version	2 bytes	Ring Version	
		0x0000: none	
		0x0001: Super Ring	
		0x0002: Rapid Super Ring	
		0x0003: Any Ring	
		0x0004: not support	

		0xFFFF: unavailable
Role	2 bytes	Ring Device Role
		0x0000: none
		0x0001: disable
		0x0002: RM (Ring Master)
		0x0003: non-RM
		0xFFFF: unavailable
Ring Port 1	4 bytes	Ring Port List of 1st Ring Port
		B[0]-B[1] : port 1-16
		B[2]-B[3] : port 17-32
1		Ex: 0x00000001: Ethernet port 1
		B[0] 0x01
		B[1] 0x00
		B[3] 0x00
		B[4] 0x00
Ring Port 2	4 bytes	Ring Port List of 2nd Ring Port
		B[0]-B[1] : port 1-16
		B[2]-B[3] : port 17-32
		Ex: 0x00000002: Ethernet port 2
		B[0] 0x02
		B[1] 0x00
		B[3] 0x00
		B[4] 0x00
RM MAC	6 bytes	Ring Master MAC address
		Ex: MAC = 00-12-77-FF-05-06
		B[0] 0x00
		B[1] 0x12
		B[2] 0x77
		B[3] 0xFF
		B[4] 0x05
		B[5] 0x06
Blocked Port List	4 bytes	Ring Blocked Port List
		B[0]-B[1] : port 1-16
		B[2]-B[3] : port 17-32
		Ex: 0x00000002: Ethernet port 2
		B[0] 0x02
		B[1] 0x00

		B[3] 0x00
		B[4] 0x00
RDH Status	2 bytes	Ring Rapid Dual Homing Status
		0x0000: None
		0x0001: Disable
		0x0002: Enable
		0xFFFF: unavailable
SuperChain Status	2 bytes	SuperChain Status
		0x0000: Disable
		0x0001: Member
		0x0002: Border
		0x0003: Border Head
		0xFFFF: unavailable

Note: The instance of Korenix Ring Class is the number of the Ring, not Ring ID.

Ex.

Ring 3

Ring 5

Instance 1→ the first ring, Ring 3

Instance 2→ the second ring, Ring 5

4.13 Device Front Panel

Device Front Panel command allows you to see LED status of the switch. You can see LED and link status of the Power, Alarm(DO), R.S. and Ports.

Feature	On / Link UP	Off / Link Down	Note
Power	Green	Black	
Alarm	Red	Black	
R.S. (Ring Status)	Green/Yellow	Black	Green: Ring in normal
			state
			Yellow: MSR in abnormal
			state
Port Link LED	Green	Black	
Port Active LED	Green	Black	
Port Link State	Green	Black	Green: The port is
			connected.
			Black: Not connected.
SFP Link State	Green	Black	Gray: Plugged but not link up yet.

JetNet 6528Gf-AC/6528Gf-2AC/6528Gf-AC-DC24/6528Gf-2DC24 Front Panel

Device Front Panel

Note: When R.S LED Blink on hardward, the Web front panel shows light with "Orange light" indication

Note: No CLI command for this feature.

4.14 Save to Flash

Save Configuration allows you to save any configuration you just made to the Flash. Powering off the switch without clicking on **Save Configuration** will cause loss of new settings. After selecting **Save Configuration**, click on **Save to Flash** to save your new configuration.

After saved the configuration successfully, the popup window appears to show Save configuration to flash ok.

Command Lines:

Feature	Command Line
Save	SWITCH# write Building Configuration [OK] Switch# copy running-config startup-config Building Configuration [OK]

4.15 Logout

The switch provides 2 logout methods. The web connection will be logged out if you don't input any command after 30 seconds. The Logout command allows you to manually logout the web connection. Click on **Yes** to logout, **No** to go back the configuration page.

Command Lines:

Feature	Command Line	
Logout	SWITCH> exit	
	SWITCH# exit	

5 Appendix

5.1 Korenix SFP family

Korenix certificated many types of SFP transceiver. These certificated SFP transceivers can be identified by *JetNet 6528Gf* and displayed in the UI. The SFP transceivers we certificated can meet up the industrial critical environment needs. We recommend you to use Korenix certificated SFP transceivers when you constructing your network.

Korenix will keep on certificating and updating the certificated SFP transceivers in Korenix web site and purchase list. You can refer to the web site to get the latest information about SFP transceivers.

Note: Poor SFP transceivers may result in poor network performance or can't meet up claimed distance or temperature.

Model Name	Spec		
SFPGSX	1000Base-SX multi-mode SFP transceiver,550m, -10~70 $^\circ\!$		
SFPGSX-w	1000Base-SX multi-mode SFP transceiver,550m, wide operating temperature, -40~85 $^{\circ}\!$		
SFPGSX2	1000Base-SX plus multi-mode SFP transceiver,2Km, -10~70 $^\circ\!$		
SFPGSX2-w	1000Base-SX plus multi-mode SFP transceiver, 2Km,wide operating temperature, -10~70 $^\circ\!$		
SFPGLX10	1000Base-LX single-mode SFP transceiver 10Km, -10~70 $^{\circ}\mathrm{C}$		
SFPGLX10-w	1000Base-LX single-mode SFP transceiver, 10Km, wide operating temperature, -40~85 $^\circ\!$		
SFPGLHX30	1000Base-LHX single-mode SFP transceiver,30Km, -10~70 $^\circ\mathrm{C}$		
SFPGLHX30-w	1000Base-LHX single-mode SFP transceiver, 30Km, wide operating temperature, -40~85 $^{\circ}\mathrm{C}$		
SFPGXD50	1000Base-XD single-mode SFP transceiver, 50Km, -10~70 $^{\circ}\mathrm{C}$		
SFPGXD50-w	1000Base-XD single-mode SFP transceiver, 50Km, wide operating temperature, -40~85 $^{\circ}\!$		
SFP100MM	Multi-mode 100Mbps 2KM Fiber Transceiver, 0~70 $^{\circ}\!$		
SFP100MM-w	Multi-mode 100Mbps 2KM Fiber Transceiver, wide operating temperature -40~85 $^{\circ}\!$		

SFP100SM30 Single mode 100Mbps 30KM Fiber Transceiver $0 \sim 70^{\circ}$ C.

SFP100SM30-w Single mode 100Mbps 30Km Fiber Transceiver, wide operating temperature. -40~85 $^{\circ}$ C

5.2 Korenix Private MIB

Korenix provides many standard MIBs for users to configure or monitor the switch's configuration by SNMP. But, since some commands can't be found in standard MIB, Korenix provides Private MIB to meet up the need. Compile the private MIB file by your SNMP tool. You can then use it. Private MIB can be found in product CD or downloaded from Korenix Web site.

Private MIB tree is similar to the web tree. This is easier to understand and use. If you are not familiar with standard MIB, you can directly use private MIB to manage /monitor the switch, no need to learn or find where the OIDs of the commands are.

The path of the JetNet 6528Gf is 1.3.6.1.4.1.24062.2.4.2.

Compile the private MIB file and you can see all the MIB tables in MIB browser.

5.3 Revision History

Edition	Date	Modifications
V1.0	Jan. 5, 2016	The first version.
V1.1	Apr. 5, 2017	Remove wrong information (32 Ports) on page 143, 145
		Role state Transition Count change to Ring state Transition Count on page 73

5.4 About Korenix

Less Time At Work! Fewer Budget on applications!

The Korenix business idea is to let you spend less time at work and fewer budget on your applications. Do you really want to go through all the troubles but still end up with low quality products and lousy services? Definitely not! This is why you need Korenix. Korenix offers complete product selection that fulfills all your needs for applications. We provide easier, faster, tailor-made services, and more reliable solutions. In Korenix, there is no need to compromise. Korenix takes care of everything for you!

Fusion of Outstandings

You can end your searching here. Korenix Technology is your one-stop supply center for industrial communications and networking products. Korenix Technology is established by a group of professionals with more than 10 year experience in the arenas of industrial control, data communications and industrial networking applications. Korenix Technology is well-positioned to fulfill your needs and demands by providing a great variety of tailor-made products and services. Korenix's industrial-grade products also come with quality services. No more searching, and no more worries. Korenix Technology stands by you all the way through.

Core Strength---Competitive Price and Quality

With our work experience and in-depth know-how of industrial communications and networking, Korenix Technology is able to combine Asia's research / development ability with competitive production cost and with quality service and support.

Global Sales Strategy

Korenix's global sales strategy focuses on establishing and developing trustworthy relationships with value added distributors and channel partners, and assisting OEM distributors to promote their own brands. Korenix supplies products to match local market requirements of design, quality, sales, marketing and customer services, allowing Korenix and distributors to create and enjoy profits together.

Quality Services

KoreCARE— KoreCARE is Korenix Technology's global service center, where our professional staffs are ready to solve your problems at any time and in real-time. All of Korenix's products have passed ISO-9000/EMI/CE/FCC/UL certifications, fully satisfying your demands for product quality under critical industrial environments. Korenix global service center's e-mail is koreCARE@korenix.com

5 Years Warranty

Each of Korenix's product line is designed, produced, and tested with high industrial standard. Korenix warrants that the Product(s) shall be free from defects in materials and workmanship for a period of five (5) years from the date of delivery provided that the Product was properly installed and used. This warranty is voided if defects, malfunctions or failures of the warranted Product are caused by damage resulting from force measure (such as floods, fire, etc.), environmental and atmospheric disturbances, other external forces such as power line disturbances, host computer malfunction, plugging the board in under power, or incorrect cabling; or the warranted Product is misused, abused, or operated, altered and repaired in an unauthorized or improper way
